THE 2009 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

## COMMUNICATION

FROM
THE BOARD OF TRUSTEES, FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

TRANSMITTING

THE 2009 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS

## LETTER OF TRANSMITTAL

BOARD OF TRUSTEES OF THE
FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS, Washington, D.C., May 12, 2009

The Honorable Nancy Pelosi
Speaker of the House of Representatives
Washington, D.C.
The Honorable Joseph R. Biden, Jr.
President of the Senate
Washington, D.C.
Dear Madam Speaker and Mr. President:
We have the honor of transmitting to you the 2009 Annual Report of the Board of Trustees of the Federal Old-Age and Survivors Insurance and Federal Disability Insurance Trust Funds, the 69th such report.

Respectfully,

## /S/

Timothy F. Geithner, Secretary of the Treasury, and Managing Trustee of the Trust Funds.

## /S/

Kathleen Sebelius, Secretary of Health and Human Services, and Trustee.
/S/
Hilda L. Solis, Secretary of Labor, and Trustee.
/S/
Michael J. Astrue, Commissioner of Social Security, and Trustee.

Vacant, Public Trustee.

# THE 2009 ANNUAL REPORT OF THE BOARD OF TRUSTEES OF THE FEDERAL OLD-AGE AND SURVIVORS INSURANCE AND FEDERAL DISABILITY INSURANCE TRUST FUNDS 

## I. INTRODUCTION

The Old-Age, Survivors, and Disability Insurance (OASDI) program in the United States makes available a basic level of monthly income upon the attainment of retirement eligibility age, death, or disability by insured workers. The OASDI program consists of two separate parts that pay benefits to workers and their families-Old-Age and Survivors Insurance (OASI) and Disability Insurance (DI). Under OASI, monthly benefits are paid to retired workers and their families and to survivors of deceased workers. Under DI, monthly benefits are paid to disabled workers and their families.

The Board of Trustees was established under the Social Security Act to oversee the financial operations of the OASI and DI Trust Funds. The Board is composed of six members. Four members serve by virtue of their positions in the Federal Government: the Secretary of the Treasury, who is the Managing Trustee; the Secretary of Labor; the Secretary of Health and Human Services; and the Commissioner of Social Security. The other two positions, which are currently vacant, are for members of the public, to be appointed by the President, subject to confirmation by the Senate. The Deputy Commissioner of the Social Security Administration (SSA) is designated as Secretary of the Board.
The Social Security Act requires that the Board, among other duties, report annually to the Congress on the actuarial (financial) status of the OASI and DI Trust Funds. This annual report, for 2009, is the 69th such report.

## Overview

## II. OVERVIEW

## A. HIGHLIGHTS

The report's major findings are summarized below.

## In 2008

At the end of 2008, almost 51 million people were receiving benefits: 35 million retired workers and dependents of retired workers, 6 million survivors of deceased workers, and 9 million disabled workers and dependents of disabled workers. During the year, an estimated 162 million people had earnings covered by Social Security and paid payroll taxes. Total benefits paid in 2008 were $\$ 615$ billion. Total income was $\$ 805$ billion, and assets held in special issue U.S. Treasury securities grew to $\$ 2.4$ trillion.

## Short-Range Results

The OASI Trust Fund and the combined OASI and DI Trust Funds are adequately financed over the next 10 years under the intermediate assumptions. The DI Trust Fund is expected to remain solvent over the next 10 years, but does not satisfy the short-range test of financial adequacy because assets are estimated to fall below 100 percent of annual expenditures by the beginning of 2014. The combined assets of the OASI and DI Trust Funds are projected to increase from $\$ 2,419$ billion at the beginning of 2009, or 354 percent of annual expenditures, to $\$ 3,874$ billion at the beginning of 2018 , or 338 percent of annual expenditures in that year. Combined assets were projected for last year's report to rise to 369 percent of annual expenditures at the beginning of 2009, and 378 percent at the beginning of 2018.

## Long-Range Results

Under the intermediate assumptions, OASDI cost will increase more rapidly than tax income between about 2012 and 2030 because the retirement of the baby-boom generation will cause the number of beneficiaries to rise much faster than the labor force. After 2030, increases in life expectancy and the continued relatively low fertility rates experienced since the baby boom will generally cause Social Security system costs to increase relative to tax income, but more slowly. Annual cost will exceed tax income starting in 2016, at which time the annual gap will be covered with cash from redemptions of special obligations of the Treasury that make up the trust fund assets until these assets are exhausted in 2037. Individually, the DI fund is projected to be exhausted in 2020 and the OASI fund in 2039. For the 75-year projection period, the actuarial deficit is 2.00 percent of taxable payroll, 0.30 percentage point larger than in last year's report. The open group unfunded
obligation for OASDI over the 75 -year period is $\$ 5.3$ trillion in present value, and is $\$ 0.9$ trillion more than the measured level of a year ago. In the absence of any changes in assumptions, methods, and starting values, the unfunded obligation would have risen to about $\$ 4.6$ trillion due to the change in the valuation date.

The OASDI annual cost rate is projected to increase from 12.35 percent of taxable payroll in 2009, to 16.76 percent in 2030 , and to 17.68 percent in 2083, a level that is 4.34 percent of taxable payroll more than the projected income rate for 2083. For last year’s report, the OASDI cost for 2083 was estimated at 17.54 percent, or 4.25 percent of payroll more than the annual income rate for that year. Expressed in relation to the projected gross domestic product (GDP), OASDI cost is estimated to rise from the current level of 4.8 percent of GDP to 6.1 percent in 2030, and then to peak at almost 6.2 percent in 2034. Thereafter, OASDI cost as a percent of GDP is projected to decline, reaching a level around 5.8 percent for the period 2050 through 2083.

The worsening of the long-range actuarial status of the OASDI program indicated in this report is principally the result of projected lower levels of economic activity that reflect the recent economic downturn and updated data, and faster reductions in mortality assumed in the longer term. Changes in the economic assumptions and the mortality assumptions contribute to about the same degree to the reduction in the program's actuarial balance.

## Conclusion

Under the long-range intermediate assumptions, annual cost will begin to exceed tax income in 2016 for the combined OASDI Trust Funds. The combined funds are then projected to become exhausted and thus unable to pay scheduled benefits in full on a timely basis in 2037. The separate DI Trust Fund, however, is projected to become exhausted in 2020.

For the combined OASDI Trust Funds to remain solvent throughout the 75year projection period, the combined payroll tax rate could be increased during the period in a manner equivalent to an immediate and permanent increase of 2.01 percentage points, benefits could be reduced during the period in a manner equivalent to an immediate and permanent reduction of 13.3 percent, general revenue transfers equivalent to $\$ 5.3$ trillion in present value could be made during the period, or some combination of approaches could be adopted. Significantly larger changes would be required to maintain solvency beyond 75 years.

## Overview

For this year's intermediate projections, real GDP starts at a lower level than was assumed last year for 2008, declines through the second quarter of 2009, levels off in the third quarter, and then begins to grow, reaching the projected stable, sustainable path by the end of 2015. These revised economic assumptions account for about half of the estimated reduction in the program's actuarial balance relative to last year's report. The effect of the recession on the actuarial balance would be smaller than projected in this report if the recovery were such that economic output substantially overshoots the projected sustainable path, a phenomenon observed in some past business cycles.

The projected trust fund deficits should be addressed in a timely way so that necessary changes can be phased in gradually and workers can be given time to plan for them. Implementing changes sooner will allow their effects to be spread over more generations. Social Security plays a critical role in the lives of 52 million beneficiaries and 160 million covered workers and their families in 2009. With informed discussion, creative thinking, and timely legislative action, present and future Congresses and Presidents can ensure that Social Security continues to protect future generations.

## B. TRUST FUND FINANCIAL OPERATIONS IN 2008

The table below shows the income, expenditures, and assets for the OASI, the DI and the combined OASDI Trust Funds in calendar year 2008.

|  | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Assets at the end of 2007. | \$2,023.6 | \$214.9 | \$2,238.5 |
| Total income in 2008 | 695.5 | 109.8 | 805.3 |
| Net contributions | 574.6 | 97.6 | 672.1 |
| Taxation of benefits | 15.6 | 1.3 | 16.9 |
| Interest | 105.3 | 11.0 | 116.3 |
| Total expenditures in 2008. | 516.2 | 109.0 | 625.1 |
| Benefit payments | 509.3 | 106.0 | 615.3 |
| Railroad Retirement financial interchange | 3.6 | . 4 | 4.0 |
| Administrative expenses | 3.2 | 2.5 | 5.7 |
| Net increase in assets in 2008 | 179.3 | . 9 | 180.2 |
| Assets at the end of 2008 . | 2,202.9 | 215.8 | 2,418.7 |

Note: Totals do not necessarily equal the sums of rounded components.
In 2008, net contributions accounted for 83 percent of total trust fund income. Net contributions consist of taxes paid by employees, employers and the self-employed on earnings covered by Social Security. These taxes were paid on covered earnings up to a specified maximum annual amount, which was $\$ 102,000$ in 2008 and is increased each year automatically (to $\$ 106,800$ in 2009) as the average wage increases. The tax rates scheduled under current law for 2008 and later are shown in table II.B2.

Table II.B2.-Tax Rates for 2008 and Later

|  | OASI | DI | OASDI |
| :--- | ---: | ---: | ---: | ---: |
| Tax rate for employees and employers, each (in percent) $\ldots \ldots \ldots$ | 5.30 | 0.90 | 6.20 |
| Tax rate for self-employed persons (in percent) $\ldots \ldots \ldots \ldots \ldots$. | 10.60 | 1.80 | 12.40 |

Two percent of OASDI Trust Fund income came from subjecting up to 50 percent of Social Security benefits above specified levels to Federal personal income taxation, and 14 percent of OASDI income came from interest earned on investment of OASDI Trust Fund reserves. Social Security's assets are invested in interest-bearing securities of the U.S. Government. In 2008, the combined trust fund assets earned interest at an effective annual rate of 5.1 percent. More than 98 percent of expenditures from the combined

## Overview

OASDI Trust Funds in 2008 went to pay retirement, survivor, and disability benefits totaling $\$ 615.3$ billion. The financial interchange with the Railroad Retirement program resulted in a payment of $\$ 4.0$ billion from the combined OASDI Trust Funds, or about 0.6 percent of total expenditures. The administrative expenses of the Social Security program were $\$ 5.7$ billion, or about 0.9 percent of total expenditures.

Assets of the trust funds provide a reserve to pay benefits whenever total program cost exceeds income. Trust fund assets increased by $\$ 180.2$ billion in 2008 because income to each fund exceeded expenditures. At the end of 2008, the combined assets of the OASI and the DI Trust Funds were 354 percent of estimated expenditures for 2009, down from an actual level of 358 percent at the end of 2007.

## C. ASSUMPTIONS ABOUT THE FUTURE

Future income and expenditures of the OASI and DI Trust Funds will depend on many factors, including the size and characteristics of the population receiving benefits, the level of monthly benefit amounts, the size of the workforce, and the level of workers’ earnings. These factors will depend in turn on future birth rates, death rates, immigration, marriage and divorce rates, retirement-age patterns, disability incidence and termination rates, employment rates, productivity gains, wage increases, inflation, and many other demographic, economic, and program-specific factors.

The intermediate demographic and economic assumptions shown in table II.C1 reflect the Trustees' best estimates of future experience, and therefore most of the figures in this overview depict only the outcomes under the intermediate assumptions. Any projection of the future is, of course, uncertain. For this reason, alternatives I (low-cost) and III (high-cost) are included to provide a range of possible future experience. The assumptions for these two alternatives are also shown in table II.C1, and their implications are highlighted in a separate section, beginning on page 14, on the uncertainty of the projections.

Assumptions are reexamined each year in light of recent experience and new information. This annual review helps to ensure that the assumptions provide the Trustees’ best estimate of future possibilities.

| Ultimate assumptions | Intermediate | Low-cost | High-cost |
| :---: | :---: | :---: | :---: |
| Total fertility rate (children per woman) | 2.0 | 2.3 | 1.7 |
| Average annual percentage reduction in total age-sexadjusted death rates from 2033 to 2083. . . . . . . . . . | . 77 | . 35 | 1.24 |
| Average annual net immigration (in thousands) over the period 2009-83. | 1,065 | 1,370 | 785 |
| Annual percentage change in: |  |  |  |
| Productivity (total U.S. economy) | 1.7 | 2.0 | 1.4 |
| Average wage in covered employment. | 3.9 | 3.5 | 4.3 |
| Consumer Price Index (CPI). | 2.8 | 1.8 | 3.8 |
| Real-wage differential (percent). | 1.1 | 1.7 | . 5 |
| Unemployment rate (percent). | 5.5 | 4.5 | 6.5 |
| Annual trust fund real interest rate (percent) . . . . . . . | 2.9 | 3.6 | 2.1 |

${ }^{\text {a }}$ Ultimate values are assumed to be reached within 25 years. See chapter V for details, including historical values and projected values prior to reaching the ultimate.

## Overview

## D. PROJECTIONS OF FUTURE FINANCIAL STATUS

## Short-Range Actuarial Estimates

For the short range (2009-2018), the Trustees measure financial adequacy by comparing projected assets at the beginning of each year to projected program cost for that year under the intermediate set of assumptions. Having a trust fund ratio of 100 percent or more-that is, assets at the beginning of each year at least equal to projected cost for the year-is considered a good indication of a trust fund's ability to cover most short-term contingencies. The projected trust fund ratios for OASI alone, and for OASI and DI combined, under the intermediate assumptions exceed 100 percent throughout the short-range period and therefore OASI and OASDI satisfy the Trustees’ short-term test of financial adequacy. Considering the DI program alone, however, its trust fund ratio is projected to fall below the 100 percent level by the beginning of 2014. Thus, DI fails to satisfy the Trustees’ short-term test of financial adequacy. Figure II.D1 below shows that the trust fund ratios for the combined OASI and DI Trust Funds reach a peak level in 2012 and begin declining thereafter.

Figure II.D1.-Short-Range OASDI Trust Fund Ratios
[Assets as a percentage of annual expenditures]

## Long-Range Actuarial Estimates

The actuarial status of the program over the next 75 years is measured in terms of annual cost and income as a percentage of taxable payroll, trust fund ratios, the actuarial balance (also as a percentage of taxable payroll), and the open group unfunded obligation (expressed in present-value dollars and as percentages of taxable payroll and gross domestic product (GDP)). Considering Social Security's annual cost and income as a percentage of the total U.S. economic output or GDP provides an additional important perspective.

The year-by-year relationship between income and cost rates shown in figure II.D2 illustrates the expected pattern of cash flows for the OASDI program over the full 75-year period. Under the intermediate assumptions, the OASDI cost rate is projected to increase rapidly and first exceed the income rate in 2016, producing cash-flow deficits thereafter. Redemption of trust fund assets will allow continuation of full benefit payments on a timely basis until 2037, when the trust funds are projected to become exhausted. This redemption process will require a flow of cash from the General Fund of the Treasury. Pressures on the Federal Budget will thus emerge well before 2037. Even if a trust fund's assets are exhausted, however, tax income will continue to flow into the fund. Present tax rates are projected to be sufficient to pay 76 percent of scheduled benefits after trust fund exhaustion in 2037 and 74 percent of scheduled benefits in 2083.

Figure II.D2.-OASDI Income and Cost Rates Under Intermediate Assumptions [As a percentage of taxable payroll]

## Overview

Social Security's cost rate is projected to rise rapidly from about 2012 through 2030 because the retirement of the baby-boom generation will cause the number of beneficiaries to rise much faster than the labor force. Thereafter, the cost rate is estimated to rise at a slower rate for about 5 years and then to remain fairly stable for the next 25 years. Continued reductions in death rates and maintaining birth rates at levels well below those from the baby-boom era and before will cause a continued increase in the average age of the population and will raise the cost rate from 16.7 percent of taxable payroll in 2060 to 17.7 percent by 2083 under the intermediate assumptions. After 2083, the increase in the average age of the population is likely to continue and to increase the gap between OASDI cost and income rates.
The estimated number of workers per beneficiary is shown in figure II.D3. There were about 3.2 workers for every OASDI beneficiary in 2008. This ratio has been extremely stable, remaining between 3.2 and 3.4 since 1974 . However, the baby-boom generation will have largely retired by 2030, and the ratio of workers to beneficiaries is projected to be only 2.2 at that time. Thereafter, the number of workers per beneficiary will slowly decline, and the OASDI cost rate will continue to increase, largely due to projected reductions in mortality.

Figure II.D3.-Number of Covered Workers Per OASDI Beneficiary

The maximum projected trust fund ratios for the OASI, DI, and combined funds appear in table II.D1. The year in which the maximum projected trust fund ratio is attained and the year in which the assets are projected to be exhausted are shown as well.

Table II.D1.-Projected Maximum Trust Fund Ratios Attained and Trust Fund Exhaustion Dates Under the Intermediate Assumptions

|  | OASI | DI | OASDI |
| :--- | ---: | ---: | ---: | ---: |
| Maximum trust fund ratio (percent) . . . . . . . . . . . | 422 | 179 | 369 |
| Year attained. . . . . . . . . . . . . . . . . . . . . . . . . . . . . . . | 2012 | 2009 | 2012 |
| Year of trust fund exhaustion. . | 2039 | 2020 | 2037 |

The actuarial balance is a measure of the program's financial status for the 75 -year valuation period as a whole. It is essentially the difference between income and cost of the program expressed as a percentage of taxable payroll over the valuation period. This single number summarizes the adequacy of program financing for the period. When the actuarial balance is negative, the actuarial deficit can be interpreted as the percentage that could be added to the current-law income rate for each of the next 75 years, or subtracted from the cost rate for each year, to bring the funds into actuarial balance. Because the effects of future changes are unlikely to follow this pattern, this measure should be viewed only as providing a rough indication of the amount of change that is needed over the 75 -year period as a whole. In this report, the actuarial balance under the intermediate assumptions is a deficit of 2.00 percent of taxable payroll for the combined OASI and DI Trust Funds. The actuarial deficit was 1.70 percent in the 2008 report and has been in the range of 1.70 percent to 2.07 percent for the last 10 reports. The actuarial deficit increases relative to the level estimated in last year's report primarily because of revised economic data through 2008, the significant near-term effects of the current economic recession, and the longer-term effects of lower ultimate mortality rates.

Another way to illustrate the financial shortfall of the OASDI system is to examine the cumulative value of income less cost, in present value. Figure II.D4 shows the present value of cumulative OASDI income less cost through the next 75 years. The balance of the combined trust funds peaks at $\$ 2.6$ trillion in 2016 (in present value) and then turns downward. This cumulative amount continues to be positive, indicating trust fund assets, or reserves, through 2036. However, after 2036 this cumulative amount becomes negative, indicating a net unfunded obligation. Through the end of 2083, the combined funds have a present-value unfunded obligation of $\$ 5.3$ trillion. This unfunded obligation represents 1.9 percent of future taxable payroll and 0.7 percent of future GDP through the end of the 75 -year

## Overview

projection period. The 0.1 percentage point difference between the unfunded obligation as a share of taxable payroll ( 1.9 percent) and the actuarial balance ( 2.0 percent) reflects the additional requirement of an ending trust fund balance equal to 1 year's cost for the actuarial balance calculation.

Figure II.D4.-Cumulative OASDI Income Less Cost, Based on Present Law Tax Rates and Scheduled Benefits
[Present value as of January 1, 2009, in trillions]

Still another important way to look at Social Security’s future is to view its annual cost and tax income as a share of U.S. economic output. Figure II.D5 shows that Social Security's cost as a percentage of GDP is projected to grow from 4.8 percent in 2009 to 6.1 percent in 2030, and then to peak at almost 6.2 percent in 2034. Thereafter, OASDI cost as a percent of GDP is projected to decline reaching a level around 5.8 percent for the period 2050 through 2083. However, Social Security’s scheduled tax revenue is projected to decline from its current level of about 5.0 percent of GDP, reaching about 4.4 percent by 2083. Income from payroll taxes declines generally in relation to GDP in the future because an increasing share of employee compensation is assumed to be provided in fringe benefits, making wages a shrinking share of GDP.

Figure II.D5.-OASDI Cost and Scheduled Tax Revenue as a Percentage of GDP

Figures II.D2, II.D4, and II.D5 show that the program's financial condition is worsening at the end of the period. Overemphasis on summary measures for a 75-year period can lead to incorrect perceptions and to policy prescriptions that do not achieve sustainable solvency. Thus, careful consideration of the trends in annual deficits and unfunded obligations toward the end of the 75year period is important. In addition, summary measures for a time period that extends to the infinite horizon are included in this report. These measures provide an additional indication of Social Security's very long-run financial condition, but are subject to much greater uncertainty. These calculations show that extending the horizon beyond 75 years increases the unfunded obligation. Over the infinite horizon, the shortfall (unfunded obligation) is $\$ 15.1$ trillion in present value, or 3.4 percent of future taxable payroll and 1.2 percent of future GDP. These calculations of the shortfall indicate that much larger changes may be required to achieve solvency beyond the 75 -year period as compared to changes needed to balance 75year period summary measures. The measured unfunded obligation over the infinite horizon is increased from $\$ 13.6$ trillion in last year's report. In the absence of any changes in assumptions, methods, and starting values, the unfunded obligation over the infinite horizon would have risen to $\$ 14.3$ trillion due to the change in the valuation date. The additional increase in the unfunded obligation over the infinite horizon is largely the result of the changes in near-term economic and ultimate mortality assumptions.

## Overview

Expressed as percentages of taxable payroll and of GDP, the measured unfunded obligation over the infinite horizon increased from 3.2 percent and 1.1 percent, respectively, in last year's report.

## Uncertainty of the Projections

Significant uncertainty surrounds the intermediate assumptions. The Trustees utilize several methods to help illustrate that uncertainty. One approach is the use of low-cost (alternative I) and high-cost (alternative III) assumptions. Figure II.D6 shows the projected trust fund ratios for the combined OASI and DI Trust Funds under the intermediate, low-cost, and high-cost assumptions. The low-cost alternative reflects a set of assumptions that improves the projected financial status of the trust funds relative to the financial status under the intermediate set of assumptions. The low-cost alternative includes a higher ultimate total fertility rate, slower improvement in mortality, a higher real-wage differential, and lower unemployment. The high-cost alternative, in contrast, includes a lower ultimate total fertility rate, more rapid improvement in mortality, a lower real-wage differential, and higher unemployment. These alternatives are not intended to suggest that all parameters would be likely to differ from the intermediate values in the same direction, but are intended to illustrate the effect of scenarios that are, on balance, very favorable or unfavorable for the program's financial status. The actual outcome for future costs is unlikely to be as extreme as either of the outcomes portrayed by the low- and high-cost projections. The method for constructing these low- and high-cost projections does not provide an estimate of the probability that actual experience will lie within or outside the range they define.

Figure II.D6.-Long-Range OASDI Trust Fund Ratios Under Alternative Assumptions [Assets as a percentage of annual cost]

This report also provides long-range sensitivity analysis for the OASDI program, varying one parameter at a time, in Appendix D. These estimates provide further illustrations of the uncertainty surrounding projections into the future, but do not provide any measure of the probability that future outcomes will fall within or outside the ranges shown.
A third approach that measures uncertainty uses stochastic simulations to develop a range of projections and does provide estimates of the probability that future outcomes will fall within or outside a given range. The results of the stochastic simulations, discussed in more detail in Appendix E, suggest that trust fund exhaustion is highly probable sometime during the 75 -year period (see figure II.D7). Further, the stochastic results suggest that outcomes as good as the low-cost alternative or as bad as the high-cost alternative are unlikely. However, the relationship between the stochastic results and the low- and high-cost alternatives may change as the methodology for the stochastic simulations is further developed. As noted in Appendix E, future improvements and refinements are expected to be more likely to expand rather than reduce the indicated range of uncertainty.

## Overview

Figure II.D7.-Annual Trust Fund Ratios

## Changes From Last Year's Report

The long-range OASDI actuarial deficit of 2.00 percent of taxable payroll for this year's report is larger than the deficit of 1.70 percent of taxable payroll shown in last year's report under intermediate assumptions. Changes in nearterm economic growth and ultimate mortality assumptions, as well as changes in starting values, are the main reasons for the increase in the deficit.

For this year's intermediate projections, real GDP growth starts at a lower level than was assumed last year for 2008 and then declines through the second quarter of 2009. The recovery from the recession brings economic activity to the projected stable, sustainable path by the end of 2015. These revised economic assumptions account for about half of the estimated reduction in the program's actuarial balance relative to last year's report. The effect of the recession on the actuarial balance would be smaller than projected in this report if the recovery were such that economic output substantially overshoots the projected sustainable path, a phenomenon observed in some past business cycles. For a detailed description of the specific changes identified in table II.D2 below, see section IV.B7 on page 68.

Table II.D2.-Reasons for Change in the 75-Year Actuarial Balance
Under Intermediate Assumptions

${ }^{\text {a }}$ In changing from the valuation period of last year's report, which was 2008-82, to the valuation period of this report, 2009-83, the relatively large negative annual balance for 2083 is included. This change in the valuation period results in a larger long-range actuarial deficit. The fund balance at the end of 2008, i.e., at the beginning of the projection period, is included in the 75-year actuarial balance.
Note: Totals do not necessarily equal the sums of rounded components.
The open group unfunded obligation over the 75 -year projection period has increased from $\$ 4.3$ trillion (present discounted value as of January 1, 2008) to $\$ 5.3$ trillion (present discounted value as of January 1, 2009). The measured unfunded obligation would be expected to increase by about $\$ 0.3$ trillion due to advancing the valuation date by 1 year and including the additional year 2083. Changes in methods, revisions in assumptions, and updated data further increased the measured unfunded obligation by about \$0.7 trillion.

Figure II.D8 shows that this year's projections of annual balances (noninterest income minus cost) are lower than those in last year's report throughout the 75 -year projection period.

## Overview

Figure II.D8.-OASDI Annual Balances: 2008 and 2009 Trustees Reports [As a percentage of taxable payroll under the intermediate assumptions]

## E. CONCLUSION

Under current law, the cost of Social Security will soon begin to increase faster than the program's income because of the aging of the baby-boom generation, expected continuing low fertility (compared to the baby-boom period), and increasing life expectancy. Based on the Trustees’ best estimate, program cost will exceed tax revenues starting in 2016 and throughout the remainder of the 75-year projection period. Social Security's combined trust funds are projected to allow full payment of scheduled benefits until they become exhausted in 2037. At that time, annual tax income to the trust funds is projected to equal about 76 percent of program costs. By 2083, annual tax income is projected to be about 74 percent as large as the annual cost of the OASDI program.

Separately, the OASI and DI funds are projected to have sufficient funds to pay full benefits on time until 2039 and 2020, respectively. The fact that the DI fund is projected to become exhausted in 2020 means that some action will likely need to be taken in the next 10 years. At a minimum, a reallocation of the payroll tax rate between OASI and DI would be necessary, as was done in 1994.

Over the full 75-year projection period, the actuarial deficit estimated for the combined trust funds is 2.00 percent of taxable payroll- 0.30 percentage point greater than the 1.70 percent deficit projected in last year's report. This deficit indicates that solvency of the combined OASDI Trust Funds for the next 75 years could be restored under the intermediate assumptions if increases were made equivalent to immediately and permanently increasing the Social Security payroll tax from its current level of 12.40 percent (for employees and employers combined) to 14.41 percent. Alternatively, changes could be made that are equivalent to reducing all current and future benefits by about 13.3 percent. Other ways of reducing the deficit include making transfers from general revenues or adopting some combination of approaches.

If no substantial action is taken until the combined trust funds become exhausted in 2037, then changes necessary to make Social Security solvent over the next 75 years will be concentrated on fewer years and fewer cohorts:

- For example, payroll taxes could be raised to finance scheduled benefits fully in every year starting in 2037. In this case, the payroll tax would be increased to about 16.26 percent at the point of trust fund exhaustion in 2037 and continue rising to about 16.74 percent in 2083.

## Overview

- Similarly, benefits could be reduced to the level that is payable with scheduled tax rates in each year beginning in 2037. Under this scenario, benefits would be reduced 24 percent at the point of trust fund exhaustion in 2037, with reductions reaching 26 percent in 2083.

Either of these examples would eliminate the shortfall for the 75 -year period as a whole by specifically eliminating annual deficits after trust fund exhaustion. Because of the increasing average age of the population (due to expected improvement in life expectancy and continued low birth rates), Social Security's annual cost will very likely continue to grow faster than scheduled tax revenues after 2083. As a result, ensuring solvency of the system beyond 2083 would likely require further changes beyond those expected to be needed for 2083.

The projected trust fund deficits should be addressed in a timely way to allow for a gradual phasing in of the necessary changes and to provide advance notice to workers. Making adjustments sooner will allow them to be spread over more generations. In 2009, Social Security plays a critical role in the lives of 52 million beneficiaries and 160 million covered workers and their families. With informed discussion, creative thinking, and timely legislative action, present and future Congresses and Presidents can ensure that Social Security continues to protect future generations.

## III. FINANCIAL OPERATIONS OF THE TRUST FUNDS AND LEGISLATIVE CHANGES IN THE LAST YEAR

## A. OPERATIONS OF THE OLD-AGE AND SURVIVORS INSURANCE (OASI) AND DISABILITY INSURANCE (DI) TRUST FUNDS, IN CALENDAR YEAR 2008

Detailed information on the operations of the OASI and DI Trust Funds ${ }^{1}$ during calendar year 2008 is presented in this section. Appendix F provides projections for calendar years 2009 through 2085.

## 1. OASI Trust Fund

A statement of the income and disbursements of the Federal Old-Age and Survivors Insurance Trust Fund in calendar year 2008, and of the assets of the fund at the beginning and end of the calendar year, is presented in table III.A1. As shown in the table, total trust fund receipts in 2008 amounted to $\$ 695.5$ billion, while disbursements totaled $\$ 516.2$ billion, resulting in an increase in trust fund assets during 2008 of $\$ 179.3$ billion. Details of the various components of trust fund income and disbursements are discussed in the following paragraphs.

Included in total receipts during calendar year 2008 were $\$ 576.7$ billion in employment tax contributions. These contributions were partially offset by transfers totaling $\$ 2.1$ billion to the general fund for the estimated amount of refunds to employees who worked for more than one employer during a year and paid contributions on total earnings in excess of the contribution and benefit base.

Net contributions thus amounted to $\$ 574.6$ billion in 2008, an increase of 2.4 percent over the corresponding amount in 2007. This increase in OASI tax contributions is due to increased earnings and the increase in the contribution and benefit base. (Table VI.A1 shows the tax rates and contribution and benefit bases in effect for past years.)

Income based on taxation of benefits amounted to \$15.6 billion in 2008. About 99 percent of this income represents amounts credited to the trust funds, on an estimated basis, generally in advance of the actual receipt of taxes by the Treasury. The remaining 1 percent of the total income from taxation of benefits represents amounts withheld from the benefits paid to nonresident aliens.

${ }^{\text {a }}$ Between - $\$ 0.5$ and $\$ 0.5$ million.
${ }^{\mathrm{b}}$ Includes (1) interest on transfers between the trust fund and the general fund account for the Supplemental Security Income program due to adjustments in the allocation of administrative expenses, (2) interest arising from the revised allocation of administrative expenses among the trust funds, and (3) interest on certain reimbursements to the trust fund.
${ }^{\text {c }}$ Reimbursements for costs incurred in performing certain legislatively mandated activities not directly related to administering the OASI program.
Note: Totals do not necessarily equal the sums of rounded components.
Special payments are made to uninsured persons who meet certain requirements. The costs associated with providing such payments are largely reimbursed from the General Fund of the Treasury. Accordingly, a transfer of about $\$ 6$ thousand was made in 2008, reflecting costs incurred in fiscal year 2007.

The OASI Trust Fund was credited with interest netting $\$ 105.3$ billion, which consisted of: (1) interest earned on the investments of the trust fund;
(2) interest on transfers between the trust fund and the general fund account for the Supplemental Security Income program due to adjustments in the allocation of administrative expenses; (3) interest arising from the revised allocation of administrative expenses among the trust funds; and (4) interest on certain reimbursements to the trust fund. The remaining \$370 thousand of receipts consisted of gifts received under the provisions authorizing the deposit of money gifts or bequests in the trust funds.

Of the $\$ 516.2$ billion in total OASI disbursements, $\$ 509.3$ billion was for net benefit payments, including the reimbursable costs of vocational rehabilitation services. ${ }^{1}$ As described in last year's report, in 2007 there was a transfer of $\$ 5.6$ billion from the OASI Trust Fund to the DI Trust Fund to correct a long-standing, but small, error in the allocation between the trust funds of the cost for certain benefit payments. The error related to payments to certain dually-entitled disabled adult children that had been made entirely from the DI Trust Fund, even though a portion should have been paid from the OASI Trust Fund. In 2008, a relatively small ( $\$ 0.3$ billion) transfer was made to correct the estimated effect of this error in fiscal year 2008. Excluding the $\$ 0.3$ billion interfund transfer due to the trust fund allocation error, net benefit payments would have been $\$ 509.0$ billion. This adjusted amount represents an increase of 4.8 percent over the corresponding adjusted amount ( $\$ 485.8$ billion) in calendar year 2007. This increase is due primarily to: (1) an increase in the total number of beneficiaries and (2) an increase in the average benefit amount. The increase in the average benefit amount in 2008 was due in large part to the automatic cost-of-living benefit increase of 2.3 percent, which became effective for December 2007 under the automaticadjustment provisions in section 215(i) of the Social Security Act.

Provisions of the Railroad Retirement Act require an annual financial interchange between the Railroad Retirement and OASDI programs. The purpose of such provisions is to put the OASI and DI Trust Funds in the same financial position they would have been had railroad employment always been covered by Social Security. Under those provisions, the Railroad Retirement Board and the Commissioner of Social Security determined that a transfer of $\$ 3.6$ billion to the Social Security Equivalent Benefit Account from the OASI Trust Fund was required in June 2008.

The remaining $\$ 3.2$ billion of disbursements from the OASI Trust Fund represented net administrative expenses. The expenses of administering the OASDI and Medicare programs are allocated and charged directly to each of

[^1]Financial Operations \& Legislative Changes
the various trust funds through which those programs are financed, on the basis of provisional estimates. Similarly, the expenses allocated for administering the Supplemental Security Income program are charged directly to the General Fund of the Treasury on a provisional basis. Periodically, as actual experience develops and is analyzed, adjustments to the allocations of administrative expenses for prior periods are effected by interfund transfers and transfers between the OASI Trust Fund and the general fund account for the Supplemental Security Income program, with appropriate interest adjustments. As described earlier, the interest adjustments arising from the reallocation of administrative expenses are recorded in the trust fund accounting under investment income.

In 2008, 79 percent of OASI net administrative expenses represented the cost of administering the program. Such costs are charged to the trust fund by the Social Security Administration ( $\$ 2.5$ billion in 2008). In addition, the Department of the Treasury charges directly to the trust fund certain expenses ( $\$ 0.7$ billion in 2008) that it incurs in helping to administer the OASI program. In addition a relatively small adjustment (\$586 thousand in 2008) to administrative expenses is an offset representing income from the sale of excess supplies and equipment.

Finally, certain net reimbursements are made from the General Fund of the Treasury for administrative costs incurred by the Social Security Administration in performing certain legislatively mandated activities that are not directly related to the OASI program. These reimbursements include the costs associated with union activities related to administering the OASI program and providing information to participants in certain pension plans. Such reimbursements totaled \$35 million in 2008.

The assets of the OASI Trust Fund at the end of calendar year 2008 totaled $\$ 2,202.9$ billion, consisting of $\$ 2,203.4$ billion in U.S. Government obligations and, as an offset, an extension of credit amounting to $\$ 0.5$ billion against securities to be redeemed within the following few days. The effective annual rate of interest earned by the assets of the OASI Trust Fund during calendar year 2008 was 5.1 percent, as compared to 5.2 percent earned during calendar year 2007. Table VI.A5, presented in appendix A, shows a detailed listing of OASI Trust Fund holdings by type of security, interest rate, and year of maturity at the end of each year 2007 and 2008.

All securities held by the trust funds are backed by the full faith and credit of the United States Government, as required by law. Those currently held by the OASI Trust Fund are special issues (i.e., securities sold only to the trust funds). These are of two types: short-term certificates of indebtedness and long-term bonds. The certificates of indebtedness are issued on a daily basis for the investment of receipts not required to meet current expenditures, and
they mature on the next June 30 following the date of issue. Special-issue bonds, on the other hand, are normally acquired only when special issues of either type mature on June 30. The amount of bonds acquired on June 30 is equal to the amount of special issues maturing, plus accrued interest, less amounts required to meet expenditures on that day.

Section 201(d) of the Social Security Act provides that the obligations issued for purchase by the OASI and DI Trust Funds shall have maturities fixed with due regard for the needs of the funds. The usual practice has been to spread the holdings of special issues, as of each June 30 , so that the amounts maturing in each of the next 15 years are approximately equal. Accordingly, the amounts and maturity dates of the OASI special-issue bonds purchased on June 30 , 2008, with an interest rate of 4 percent, were selected so that the maturity dates of the total portfolio of special issues were spread evenly over the 15 -year period 2009-23. The amount of bonds purchased on June 30, 2008, is shown in table III.A7.

## 2. DI Trust Fund

A statement of the income and disbursements of the Federal Disability Insurance Trust Fund in calendar year 2008, and of the assets of the fund at the beginning and end of the calendar year, is presented in table III.A2.

Table III.A2.-Operations of the DI Trust Fund, Calendar Year 2008

| Total receipts |  | 109,840 |
| Disbursements: |  |  |
| Benefit payments: |  |  |
| Monthly benefits. | 106,301 |  |
| Transfer from the OASI Trust Fund to correct a trust fund allocation error made on payments to certain dually entitled disabled beneficiaries . | -339 |  |
| Reimbursement from the general fund for unnegotiated checks | -30 |  |
| Payment for costs of vocational rehabilitation services for disabled beneficiaries . | 75 |  |
| Net benefit payments |  | 106,007 |
| Transfer to the Railroad Retirement "Social Security Equivalent Benefit Account" . |  | 418 |
| Administrative expenses: |  |  |
| Costs incurred by: |  |  |
| Social Security Administration. | 2,368 |  |
| Department of the Treasury | 133 |  |
| Miscellaneous reimbursements from the general fund ${ }^{\text {b }}$. | 26 |  |
| Total administrative expenses. |  | 2,526 |
| Total disbursements |  | 108,951 |
| Net increase in assets . |  | 889 |
| Total assets, December 31, 2008 |  | 215,773 |

${ }^{\text {a }}$ Includes (1) interest on transfers between the trust fund and the general fund account for the Supplemental Security Income program due to adjustments in the allocation of administrative expenses, (2) interest arising from the revised allocation of administrative expenses among the trust funds, and (3) interest on certain reimbursements to the trust fund.
${ }^{\mathrm{b}}$ Reimbursements for costs incurred in performing certain legislatively mandated activities not directly related to administering the DI program.

Note: Totals do not necessarily equal the sums of rounded components.
Line entries in the DI statement are similar to those in the OASI statement and the explanations of the OASI entries generally apply to DI as well.

Net contributions amounted to $\$ 97.6$ billion, an increase of 2.4 percent from the amount in the preceding calendar year. This increase is attributable to the same factors, insofar as they apply to the DI program, which accounted for the change in contributions to the OASI Trust Fund.

Of the $\$ 109.0$ billion in total disbursements, $\$ 106.0$ billion was for net benefit payments. Excluding the $\$ 0.3$ billion interfund transfer due to the trust fund allocation error, net benefit payments would have been $\$ 106.3$ billion. This adjusted amount represents an increase of 7.3 percent over the corre-
sponding amount in calendar year 2007. This increase in DI benefit payments was due to the same factors that resulted in the net increase in benefit payments from the OASI Trust Fund. However, the number of persons receiving benefits from the DI Trust Fund increased more rapidly in 2008 than the number receiving benefits from the OASI Trust Fund largely due to a) the current ages of the baby-boom generation, b) the recent increase in the normal retirement age (NRA), and c) the special administrative action, undertaken by SSA beginning in 2001, to identify and award benefits from the DI Trust Fund to a substantial number of current and former recipients of SSI benefits whose disability-insured status under the DI program was not previously recognized. Total DI disbursements, which started to exceed noninterest income in 2005, continue to exceed such income in 2008. However, as in 2005 through 2007, total DI income (including interest) in 2008 exceeds total disbursements.

The assets of the DI Trust Fund at the end of calendar year 2008 totaled $\$ 215.8$ billion, consisting of $\$ 215.8$ billion in U.S. Government obligations and, as an offset, an extension of credit amounting to $\$ 37$ million against securities to be redeemed within the following few days. The effective annual rate of interest earned by the assets of the DI Trust Fund during calendar year 2008 was 5.2 percent, as compared to 5.3 percent earned during calendar year 2007. Table VI.A6, presented in appendix A, shows a detailed listing of DI Trust Fund holdings by type of security, interest rate, and year of maturity at the end of each year 2007 and 2008.

## Financial Operations \& Legislative Changes

## 3. OASI and DI Trust Funds, Combined

A statement of the operations of the income and disbursements of the OASI and DI Trust Funds, on a combined basis, is presented in table III.A3. The entries in this table represent the sums of the corresponding values from tables III.A1 and III.A2. For a discussion of the nature of these income and expenditure transactions, reference should be made to the two preceding subsections covering OASI and DI separately.

Table III.A3.-Operations of the Combined OASI and DI Trust Funds, Calendar Year 2008

| Estimate in 2004 report | 680.6 | 1.3 | 585.0 | -4.9 |
| Estimate in 2005 report | 681.5 | 1.4 | 596.1 | -3.1 |
| Estimate in 2006 report | 690.6 | 2.8 | 610.7 | -. 7 |
| Estimate in 2007 report | 689.2 | 2.5 | 607.9 | -1.2 |
| Estimate in 2008 report | 682.1 | 1.5 | 613.7 | -. 3 |
| Actual amount . . . . . . . . . . . . . . . . | 672.1 | - | 615.3 | - |

${ }^{\text {a }}$ The estimates shown are based on the intermediate assumptions.
b "Actual" contributions for 2008 reflect adjustments for prior calendar years (see Appendix A on page 138 for description of these adjustments). "Estimated" contributions also include such adjustments, but on an estimated basis.
${ }^{\text {c }}$ Between -0.05 and 0.05 percent.
${ }^{\mathrm{d}}$ Excludes interfund transfer to correct a trust fund allocation error made on payments to certain disabled beneficiaries. The transfer amounted to $\$ 0.3$ billion from OASI to DI.

A number of factors can contribute to differences between estimates and subsequent actual amounts, including actual values for key demographic, economic, and other variables that differ from assumed levels. In addition, new legislation or other administrative initiatives that were unanticipated at the time the earlier estimates were completed can contribute to such differences.

At the end of calendar year 2008, about 50.9 million persons were receiving monthly benefits under the OASDI program. Of these persons, about 41.6 million and 9.3 million were receiving monthly benefits from the OASI Trust Fund and the DI Trust Fund, respectively. The number of persons

[^2]
## Financial Operations \& Legislative Changes

receiving benefits from the OASI and DI Trust Funds grew by 1.7 percent and 4.0 percent, respectively, during the calendar year. The estimated distributions of benefit payments in calendar years 2007 and 2008, by type of beneficiary, are shown in table III.A5 for each trust fund separately.

Table III.A5.-Distribution of Benefit Payments by Type of Beneficiary or Payment, Calendar Years 2007 and 2008

| of total |

${ }^{\text {a }}$ Less than 0.05 percent.
${ }^{\mathrm{b}}$ Less than $\$ 0.5$ million.
Note: Benefits are monthly benefits and lump-sum death payments. Totals do not necessarily equal the sums of rounded components.

Net administrative expenses charged to the OASI and DI Trust Funds in calendar year 2008 totaled $\$ 5.7$ billion. This amount represented 0.9 percent of contribution income and 0.9 percent of expenditures. Corresponding percentages for each trust fund separately and for the OASDI program as a whole are shown in table III.A6 for each of the last 5 years.

Table III.A6.-Administrative Expenses as a Percentage of Contribution Income and of Total Expenditures, Calendar Years 2004-08

## B. SOCIAL SECURITY AMENDMENTS SINCE THE 2008 REPORT

Since the 2008 Annual Report was transmitted to Congress on March 25, 2008, one law was enacted that had a direct financial effect on the OASDI program. The Food, Conservation, and Energy Act of 2008, Public Law 110246, was enacted on June 18, 2008. It included provisions to exclude conservation reserve program payments from self-employment income for purposes of the Self-Employment Contributions Act (SECA) for individuals who are receiving Social Security retirement or disability benefits and to transfer funds from the General Fund of the Treasury to the OASI and DI Trust Funds for fiscal years 2009 through 2017 to ensure that the assets of the trust funds are not reduced as a result of enactment of this Act. Another provision increases the amount of net earnings from self-employment that can be declared for SECA tax purposes and thus credited to individuals who file under the optional method of reporting self-employment earnings. These provisions are estimated to have negligible financial effects on the OASDI program.

The Congress has also enacted legislation to stabilize the banking system and to stimulate the economy. The Emergency Economic Stabilization Act of 2008 (Public Law 110-343, enacted on October 3, 2008) allows the government to purchase troubled assets and stocks to strengthen financial institutions. The American Recovery and Reinvestment Act of 2009 (Public Law 111-5, enacted on February 17, 2009) includes some reductions in personal income taxes and increases in government expenditures. These policies are expected to affect the speed and timing of the economic recovery from the current recession.

## IV. ACTUARIAL ESTIMATES

This chapter presents actuarial estimates of the future financial condition of the Social Security program. These estimates include projected income and cost of the OASI and DI Trust Funds, in dollars over the next 10 years and as a percentage of taxable payroll or in present-value dollars over the full 75 -year period, along with a discussion of a variety of measures of the adequacy of current program financing. In this report we carefully distinguish between (1) the cost (or obligations) of the program, which includes, for the future, all benefits scheduled under current law, and (2) expenditures (disbursements or outgo), which include actual payments for the past and only the portion of the cost of the program that is projected to be payable with the financing provisions in current law.
As described in the Overview section of this report, these estimates depend upon a broad set of demographic, economic, and programmatic factors. Since assumptions related to these factors are subject to uncertainty, the estimates presented in this section are prepared under three sets of assumptions, to show a range of possible outcomes. The intermediate set of assumptions, designated as alternative II, reflects the Trustees' best estimate of future experience; the low-cost alternative I is more optimistic and the high-cost alternative III more pessimistic for the trust funds’ future financial outlook. The intermediate estimates are shown first in the tables in this report, followed by the low-cost and high-cost estimates. These sets of assumptions, along with actuarial methods used to produce the estimates, are described in chapter V. In this chapter, the estimates and measures of trust fund financial adequacy for the short range (2009-18) are presented first, followed by estimates and measures of actuarial status for the long range (2009-83) and for the infinite future. As an additional illustration of uncertainty, estimated probability distributions of certain measures are presented in Appendix E.

## A. SHORT-RANGE ESTIMATES

Financial adequacy, or solvency, of the trust funds reflects the ability to pay scheduled benefits in full on a timely basis and is generally assessed using the "trust fund ratio," which is defined as the assets at the beginning of a year expressed as a percentage of the projected cost for the year. Thus, the trust fund ratio represents the proportion of a year's cost that can be paid with the funds available at the beginning of the year. A trust fund ratio of 100 percent of annual program cost is generally assumed to provide a reasonable "contingency reserve." During periods when trust fund income exceeds disbursements, the excess is held in the trust funds. To the extent that trust fund assets exceed 100 percent of annual cost, the excess is dedicated to advance fund a portion of the Social Security program's future financial obligations. During periods when trust fund disbursements exceed income, as might happen during an economic recession, trust fund assets are used to meet the shortfall. In the event of recurring shortfalls for an extended period, the trust funds can

## Actuarial Estimates

allow time for the development, enactment, and implementation of legislation to restore financial stability to the program.

The short-range test of financial adequacy is applicable to the OASI and DI Trust Funds individually and on a combined basis. The requirements of this test are as follows: If the estimated trust fund ratio is at least 100 percent at the beginning of the projection period, then it must be projected to remain at or above 100 percent throughout the 10-year projection period. Alternatively, if the ratio is initially less than 100 percent, then it must be projected to reach a level of at least 100 percent within 5 years (and not be depleted at any time during this period) and to remain at or above 100 percent throughout the remainder of the 10 -year period. In addition, the fund's estimated assets at the beginning of each month of the 10-year period must be sufficient to cover that month's disbursements. This test is applied on the basis of the intermediate estimates. Failure to meet this test by either trust fund is an indication that solvency of the program over the next 10 years is in question and that legislative action is needed to improve the short-range financial adequacy of the program.

## 1. Operations of the OASI Trust Fund

This subsection presents estimates of the operations and financial status of the OASI Trust Fund for the period 2009-18, based on the assumptions described in chapter V. No changes are assumed to occur in the present statutory provisions and regulations under which the OASDI program operates. ${ }^{1}$

These estimates are shown in table IV.A1 and indicate that the assets of the OASI Trust Fund would continue to increase rapidly throughout the next 10 years under all three sets of assumptions. Also, based on the intermediate assumptions, the assets of the OASI Trust Fund would continue to exceed 100 percent of annual expenditures by a large amount through the end of 2018. Consequently, the OASI Trust Fund satisfies the test of short-range financial adequacy by a wide margin. The estimates in table IV.A1 also indicate that the short-range test would be satisfied even under the high-cost assumptions (see figure IV.A1 for graphical illustration of these results).

The increases in estimated income shown in table IV.A1 under each set of assumptions reflect increases in estimated OASDI taxable earnings and growth in interest earnings on the invested assets of the trust fund. For each alternative, employment is assumed to decrease in 2009 and, for alternative III only, in 2010. Thereafter, employment is assumed to increase in every year through 2018 for each alternative. The number of persons with taxable

[^3]earnings would increase on the basis of alternatives I, II, and III from 162 million during calendar year 2008 to about 177 million, 174 million, and 171 million, respectively, in 2018. The total annual amount of taxable earnings is projected to increase in every year through 2018 for each alternative. Total earnings increase from $\$ 5,511$ billion in 2008 to $\$ 8,319$ billion, $\$ 8,329$ billion, and $\$ 8,710$ billion, in 2018, on the basis of alternatives I, II, and III, respectively. ${ }^{1}$ These increases in taxable earnings are due primarily to (1) projected increases in employment levels as the working age population increases, (2) increases in average earnings in covered employment (reflecting both real growth and price inflation), and (3) increases in the contribution and benefit base during the period 2009-18 under the automaticadjustment provisions.

Growth in interest earnings represents a significant component of the overall increase in trust fund income during this period. Although interest rates payable on trust fund investments are assumed to temporarily decline from current levels, the continuing rapid increase in OASI assets will result in a corresponding net increase in interest income. By 2018, interest income to the OASI Trust Fund is projected to be about 18 percent of total trust fund income on the basis of the intermediate assumptions, as compared to 15 percent in 2008.

${ }^{\text {a }}$ A detailed description of the components of income and cost, along with complete historical values, is presented in Appendix A.
b "Total Income" column includes transfers made between the OASI Trust Fund and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for (1) the cost of noncontributory wage credits for military service before 1957, and (2) the cost of benefits to certain uninsured persons who attained age 72 before 1968. In December 2005, $\$ 350$ million was transferred from the OASI Trust Fund to the General Fund of the Treasury for the cost of pre-1957 military service wage credits. After 2008 such transfers are estimated to be less than $\$ 500,000$ in each year.
${ }^{\text {c The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at }}$ the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
Note: Totals do not necessarily equal the sums of rounded components.

Rising expenditures during 2009-18 reflect automatic benefit increases as well as the upward trend in the number of beneficiaries and in the average monthly earnings underlying benefits payable by the program. The growth in the number of beneficiaries in the past and the expected growth in the future result both from the increase in the aged population and from the increase in the proportion of the population that is eligible for benefits.

The estimates under all three sets of assumptions shown in table IV.A1 indicate that income to the OASI Trust Fund would substantially exceed expenditures in every year of the short-range projection period, and assets are therefore estimated to increase substantially.
The portion of the OASI Trust Fund that is not needed to meet day-to-day expenditures is used to purchase financial securities, generally special pub-lic-debt obligations of the U.S. Government. The cash used to make these purchases flows to the General Fund of the Treasury and is used to meet various Federal outlays or to reduce the amount of publicly-held Federal debt. Interest on these securities is credited to the trust fund and, when the securities mature, they are reinvested in new securities if not immediately needed to pay program costs. When securities are redeemed prior to maturity in order to pay program costs, general fund revenues flow to the trust fund. Thus, the investment operations of the trust fund result in various credits and cash flows between the trust fund and the General Fund of the Treasury.

## 2. Operations of the DI Trust Fund

The estimated operations and financial status of the DI Trust Fund during calendar years 2009-18 under the three sets of assumptions are shown in table IV.A2, together with values for actual experience during 2004-08. Income is generally projected to increase steadily under each alternative, reflecting most of the same factors described previously in connection with the OASI Trust Fund. DI Trust Fund assets are projected to begin to decrease in 2009 under each alternative. Under the low-cost assumptions, assets would begin to increase again after reaching a low point in 2012. Under the intermediate assumptions, assets would continue to decline through 2018. Under the high-cost assumptions, DI assets would decline steadily until exhaustion in 2016.

Cost is estimated to increase in part due to increases in average benefit levels resulting from (1) automatic benefit increases and (2) projected increases in the amounts of average monthly earnings on which benefits are based. In addition, under all three sets of assumptions, the number of DI beneficiaries in current-payment status is projected to continue increasing throughout the short-range projection period. Over the period 2008-18, the projected annual average growth rate in the number of DI worker beneficiaries is roughly 0.9 , 2.3 , and 3.5 percent under alternatives I, II, and III, respectively. Growth is

## Actuarial Estimates

largely attributable to the gradual progression of the baby-boom generation through ages 50 to normal retirement age, at which ages higher rates of disability incidence are experienced. The estimates under all three sets of assumptions anticipate additional growth in the numbers of DI worker beneficiaries due to a projected sharp, but temporary, increase in incidence rates to levels comparable to some of the highest ever experienced under the DI program. These increases are projected to result from the current economic recession. The projected higher levels of disability incidence are expected to subside as the economy recovers, and to return to levels comparable to those projected in last year's report. ${ }^{1}$
The proportion of DI beneficiaries whose benefits terminate in a given year has also fluctuated in the past. Over the last 20 years, the rates of benefit termination due to death or conversion to retirement benefits (at attainment of normal retirement age) have declined very gradually. This trend is attributable, in part, to the lower average age of new beneficiaries. Declines in mortality for the general population have also led to improved mortality experience among the DI disabled-worker beneficiaries. In addition, conversions to old-age benefits were at a temporarily reduced level for years 2003 through 2008 due to the gradual increase in the normal retirement age. The termination rate due to recovery has been much more volatile. Currently, the proportion of disabled beneficiaries whose benefits cease because of their recovery from disability is very low in comparison to levels experienced throughout the 1970s and early 1980s. Projected rates of recovery terminations in this year's report are temporarily elevated in years 2011-14 due to increased funding for the purpose of reducing the backlog of continuing disability reviews (CDRs) conducted by SSA. Following this temporary increase in CDRs, recovery termination rates are projected to return to levels consistent with (1) projected levels of work terminations and (2) the assumption that terminations for medical improvement will be consistent with continued timely completion of CDRs after 2014. The overall proportion of disabled workers leaving the DI rolls (reflecting all causes) is projected to return to higher levels in 2009 when the gradual increase in the normal retirement age temporarily ceases.

${ }^{\text {a }}$ A detailed description of the components of income and cost, along with complete historical values, is presented in Appendix A.
b "Total Income" column includes transfers made between the DI Trust Fund and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for the cost of noncontributory wage credits for military service before 1957. In particular, a transfer was made in December 2007 in the amount of $\$ 7.7$ million from the General Fund of the Treasury to the DI Trust Fund. After 2008 such transfers are estimated to be less than $\$ 500,000$ in each year.
${ }^{\text {c }}$ The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
${ }^{\text {d }}$ Under the high-cost assumptions, the DI Trust Fund is projected to be exhausted in 2016. Therefore, certain trust fund operation values for 2016 to 2018 are not meaningful under present law and are not shown in this table.

Note: Totals do not necessarily equal the sums of rounded components.

At the beginning of calendar year 2008, the assets of the DI Trust Fund represented 197 percent of annual expenditures. During 2008, DI expenditures continued to exceed noninterest income. Although total DI income exceeded DI expenditures by $\$ 0.9$ billion, the trust fund ratio for the beginning of 2009 still decreased, to about 179 percent. Under the intermediate set of assumptions, expenditures are estimated to exceed total income from 2009 through 2018. The projected expenditures in excess of income result in a decline in the projected trust fund ratio to 40 percent by the beginning of 2018.

Under the low-cost assumptions, the trust fund ratio would decrease to a low of 147 percent at the beginning of 2014 , before increasing to 155 percent at the beginning of 2018. Under the high-cost assumptions, the assets of the DI Trust Fund would decline steadily, dipping below the level of 1 year's expenditures during 2012, and becoming completely depleted in 2016.

Assets of the DI Trust Fund were greater than 1 year's expenditures at the beginning of 2009. By the beginning of 2014, however, the trust fund ratio is projected to decline to 98 percent. Accordingly, the DI Trust Fund does not satisfy the Trustees’ short-range test of financial adequacy under both the intermediate and high-cost assumptions. However, under the low-cost assumptions the DI Trust Fund does meet the short-range test of financial adequacy, because assets remain above 1 year's expenditures through the end of the short-range period, as described above (see also figure IV.A1).

## 3. Operations of the Combined OASI and DI Trust Funds

The estimated operations and status of the OASI and DI Trust Funds, combined, during calendar years 2009-18 on the basis of the three alternatives, are shown in table IV.A3, together with figures on actual experience in 2004-08. Because income and cost for the OASI Trust Fund represent over 80 percent of the corresponding amounts for the combined OASI and DI Trust Funds, the operations of the OASI Trust Fund tend to dominate the combined operations of the two funds. Consequently, based on the strength of the OASI Trust Fund over the next 10 years, the combined OASI and DI Trust Funds meet the requirements of the short-range test of financial adequacy under all three alternative sets of assumptions.

While combining the operations of the OASI and DI Trust Funds permits an assessment of the short-range test for the two programs on a combined basis, in practice assets from one trust fund cannot be shared with another trust fund without legislative changes to the Social Security Act. For example, under the high-cost scenario, table IV.A2 shows that the DI Trust Fund becomes exhausted in 2016. The value of the combined OASI and DI Trust Funds in that year shown in table IV.A3 shows that OASI assets could be made available to pay DI benefits through 2018, but only with legislation to permit this action.

${ }^{\text {a }}$ A detailed description of the components of income and cost, along with complete historical values, is presented in Appendix A.
b "Total Income" column includes transfers made between the OASI and DI Trust Funds and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for (1) the cost of noncontributory wage credits for military service before 1957, and (2) the cost of benefits to certain uninsured persons who attained age 72 before 1968.
${ }^{\text {c }}$ The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
Note: Totals do not necessarily equal the sums of rounded components.

## 4. Factors Underlying Changes in 10-Year Trust Fund Ratio Estimates From the 2008 Report

The factors underlying the changes in the intermediate estimates for the OASI, DI and the combined funds from last year's annual report to this report are analyzed in table IV.A4. In the 2008 Annual Report, the trust fund ratio for OASI was estimated to reach 438 percent at the beginning of 2017-the tenth projection year from that report. If there had been no changes to the projections, the estimated ratio at the beginning of 2018 would be 7 percentage points lower than at the beginning of 2017, or 431 percent. There were changes, however, to reflect the latest actual data, as well as adjustments to the assumptions for future years and the projection methods. The resulting ratio shown in this report for the tenth projection year (2018) is 394 percent. The net effect of changes in demographic assumptions over the short-range period resulted in a reduction in the tenth-year trust fund ratio of 2 percentage points. The cumulative net effects of changes in economic data and assumptions resulted in a reduction in the trust fund ratio of 26 percentage points by the beginning of 2018. The change due to economic assumptions reflects the effects of the economic recession that started in December 2007 on revenue and benefit levels. There were several relatively minor changes in the short-range projection methodology since the 2008 report. The changes included improvements in the methods for estimating the numbers of beneficiaries and average benefit amounts at the end of each quarter, given numbers and average amounts at the end of each calendar year. The combined effect of the various methodological improvements was to increase the ending trust fund ratio by about 2 percentage points. Finally, a decrease in the 2018 trust fund ratio of 12 percentage points resulted from the combined effects of incorporating recent programmatic data including the further correction of the trust fund allocation error described in section III.A.

Corresponding estimates of the factors underlying the changes in the financial projections for the DI Trust Fund, and for the OASI and DI Trust Funds combined, are also shown in table IV.A4. The largest effects on the DI trust fund ratio at the beginning of 2018 are due to the revised economic assumptions and updates for programmatic data and assumptions. In particular, temporary increases in disability incidence rates related to the current recession make up about 20 percentage points of the 31 percentage point reduction attributable to programmatic assumptions. The change in the valuation period accounts for the remainder of the total change in the DI trust fund ratio.

a The effects of enactment of the Food, Conservation, and Energy Act of 2008; the Emergency Economic Stabilization Act of 2008; and the American Recovery and Reinvestment Act of 2009 on economic growth are reflected in the short-term economic assumptions used for this report.
${ }^{\mathrm{b}}$ Change in trust fund ratio of less than 0.5 percentage point.
Note: Totals do not necessarily equal the sums of rounded components.

## B. LONG-RANGE ESTIMATES

Three types of financial measures are useful in assessing the actuarial status of the Social Security trust funds under the financing approach specified in current law: (1) annual cash-flow measures, including income and cost rates, and balances; (2) trust fund ratios; and (3) summary measures like actuarial balances and unfunded obligations. The first long-range estimates presented are the series of projected annual balances (or net cash flow), which are the differences between the projected annual income rates and annual cost rates (expressed as percentages of the taxable payroll). In assessing the financial condition of the program, particular attention should be paid to the level of the annual balances at the end of the long-range period and the time at which the annual balances may change from positive to negative values.

The next measure discussed is the pattern of projected trust fund ratios. The trust fund ratio represents the proportion of a year's projected cost that could be paid with the funds available at the beginning of the year. Particular attention should be paid to the level and year of maximum trust fund ratio, to the year of exhaustion of the funds, and to the stability of the trust fund ratio in cases where the ratio remains positive at the end of the long-range period. When a program has positive trust fund ratios throughout the 75-year projection period and these ratios are stable or rising at the end of the period, the program financing is said to achieve sustainable solvency.

The final measures discussed in this section summarize the total income and cost over valuation periods that extend through 75 years, and to the infinite horizon. These measures indicate whether projected income will be adequate for the period as a whole. The first such measure, actuarial balance, indicates the size of any surplus or shortfall as a percentage of the taxable payroll over the period. The second, open group unfunded obligation, indicates the size of any shortfall in present-value dollars. This section also includes a comparison of covered workers to beneficiaries, a generational decomposition of the infinite future unfunded obligation, the test of long-range close actuarial balance, and the reasons for change in the actuarial balance from the last report.

If the 75-year actuarial balance is zero (or positive), then the trust fund ratio at the end of the period will be at 100 percent (or greater), and financing for the program is considered to be adequate for the 75 -year period as a whole. Financial adequacy, or solvency, for each year is determined by whether the trust fund asset level is positive throughout the year. Whether or not financial adequacy is stable in the sense that it is likely to continue for subsequent 75year periods in succeeding reports is also important when considering the actuarial status of the program. One indication of this stability, or sustainable solvency, is the behavior of the trust fund ratio at the end of the projection
period. If trust fund ratios for the last several years of the long-range period are positive and are at a constant or rising level, then it is likely that subsequent Trustees Reports will also show projections of financial adequacy (assuming no changes in demographic and economic assumptions, or the law). The actuarial balance and the open group unfunded obligation for the infinite future provide additional measures of the financial status of the program for the very long range.

## 1. Annual Income Rates, Cost Rates, and Balances

Basic to the consideration of the long-range actuarial status of the trust funds are the concepts of income rate and cost rate, each of which is expressed as a percentage of taxable payroll. Other measures of the cash flow of the program are shown in Appendix F. The annual income rate is the sum of the tax contribution rate and the ratio of income from taxation of benefits to the OASDI taxable payroll for the year. The OASDI taxable payroll consists of the total earnings that are subject to OASDI taxes, with some relatively small adjustments. ${ }^{1}$
The annual cost rate is the ratio of the cost of the program to the taxable payroll for the year. The cost is defined to include scheduled benefit payments, administrative expenses, net transfers from the trust funds to the Railroad Retirement program under the financial-interchange provisions, and payments for vocational rehabilitation services for disabled beneficiaries. For any year, the income rate minus the cost rate is referred to as the balance for the year. ${ }^{2}$

Table IV.B1 presents a comparison of the estimated annual income rates and cost rates by trust fund and alternative. Detailed long-range projections of trust fund operations, in current dollar amounts, are shown in table VI.F8.

The projections for OASI under the intermediate assumptions show the income rate rising due to the gradually increasing effect of the taxation of benefits. The projected income from the taxation of benefits, expressed as a percentage of taxable payroll, is expected to increase for two reasons. First, benefits are rising faster than payroll. Second, the benefit-taxation threshold amounts are not indexed, so that an increasing share of beneficiaries will be paying tax on their benefits. The pattern of the cost rate is much different. The cost rate rises in 2009 and 2010 due to the projected economic recession,

[^6]and then comes back down through 2012 due to the recovery. From about 2012 to 2030, the cost rate rises rapidly because the retirement of the babyboom generation will cause the number of beneficiaries to rise much faster than the labor force. After 2030, the cost rate remains fairly stable for about 30 years because the number of workers and beneficiaries are projected to rise at the same rate. Thereafter, the cost rate rises slowly, reflecting projected reductions in death rates and continued relatively low birth rates. The cost rate reaches 15.35 percent of taxable payroll for 2083. By comparison, the income rate reaches 11.48 percent of taxable payroll for 2083.

Projected income rates under the low-cost and high-cost sets of assumptions are very similar to those projected for the intermediate assumptions because they are largely a reflection of the tax rates specified in the law. OASI cost rates for the low-cost and high-cost assumptions differ significantly from those projected for the intermediate assumptions. For the low-cost assumptions, the cost rate decreases from 2010 through 2013, then rises, until it peaks in 2033 at a level of 13.01 percent of payroll. The cost rate then generally declines gradually, reaching a level of 10.92 percent of payroll for 2083 (at which point the income rate reaches 11.22 percent). For the high-cost assumptions, the cost rate rises from 2011 through the end of the 75-year period. It rises at a relatively fast pace between 2011 and 2030 because of the aging of the baby-boom generation. Subsequently, the projected cost rate continues rising and reaches 22.41 percent of payroll for 2083 (at which point the income rate reaches 11.88 percent).
The pattern of the projected OASI annual balance is important in the analysis of the financial condition of the program. Under the intermediate assumptions, the annual balance is positive for 8 years (through 2016) and is negative thereafter. This annual deficit rises rapidly, reaching 2 percent of taxable payroll by 2024, and continues rising generally thereafter, to a level of 3.87 percent of taxable payroll for 2083.

Under the low-cost assumptions, the projected OASI annual balance is positive for 11 years (through 2019) and then becomes negative, with the annual deficit peaking at 1.74 percent of taxable payroll for 2033. Then, the annual deficit declines until 2065, when the OASI annual balance becomes positive, reaching a surplus of 0.30 percent of payroll in 2083. Under the high-cost assumptions, in contrast, the OASI balance is projected to be positive for only 5 years (through 2013) and to be negative thereafter, with a deficit of 2.19 percent for 2020, 6.30 percent for 2050, and 10.53 percent of payroll for 2083.

${ }^{\text {a }}$ Historical income rates are modified to include adjustments to the lump-sum payments received in 1983 from the General Fund of the Treasury for the cost of noncontributory wage credits for military service in 1940-56.
${ }^{\mathrm{b}}$ Between -0.005 and 0.005 percent of taxable payroll.
${ }^{\text {c }}$ The annual balance is projected to be negative for a temporary period, returning to positive levels before the end of the projection period.

## Notes:

1. The income rate excludes interest income and certain transfers from the General Fund of the Treasury.
2. Some historical values are subject to change due to revisions of taxable payroll.
3. Totals do not necessarily equal the sums of rounded components.

Under the intermediate assumptions, the cost rate for DI fluctuates between 2.15 and 2.30 percent of taxable payroll from 2009 to 2034, generally increasing thereafter to 2.34 percent for 2083. The income rate increases only very slightly from 1.84 percent of taxable payroll for 2009 to 1.87 percent for 2083. The annual deficit is about 0.34 percent in 2009 and reaches 0.47 percent for 2083.
Under the low-cost assumptions, the DI cost rate peaks at 2.15 percent of payroll for 2010, then generally declines slowly thereafter, reaching 1.57 percent for 2083. The annual balance is negative for the first 7 years and is positive throughout the remainder of the long-range period. For the highcost assumptions, DI cost rises much more, reaching 3.29 percent for 2083. The annual deficit is about 0.39 percent in 2009 and reaches 1.39 percent for 2083.

Figure IV.B1 shows in graphical form the patterns of the OASI and DI annual income rates and cost rates. The income rates shown here are only for alternative II in order to simplify the graphical presentation because, as shown in table IV.B1, the variation in the income rates by alternative is very small. Income rates increase generally, but at a slow rate for each of the alternatives over the long-range period. Both increases in the income rate and variation among the alternatives result from the relatively small component of income from taxation of benefits. Increases in income from taxation of benefits reflect increases in the total amount of benefits paid and the fact that an increasing share of individual benefits will be subject to taxation because benefit taxation threshold amounts are not indexed.

The patterns of the annual balances for OASI and DI can be inferred from figure IV.B1. For each alternative, the magnitude of each of the positive balances, as a percentage of taxable payroll, is represented by the distance between the appropriate cost-rate curve and the income-rate curve above it. The magnitude of each of the deficits is represented by the distance between the appropriate cost-rate curve and the income-rate curve below it.

In the future, the cost of OASI, DI and the combined OASDI programs as a percentage of taxable payroll will not necessarily be within the range encompassed by alternatives I and III. Nonetheless, because alternatives I and III define a reasonably wide range of demographic and economic conditions, the resulting estimates delineate a reasonable range for consideration of potential future program costs.

## Actuarial Estimates

Figure IV.B1.-Long-Range OASI and DI Annual Income Rates and Cost Rates [As a percentage of taxable payroll]

Thus far in this section, the cost and income of the OASDI program have been discussed with reference to their size relative to taxable payroll, which is the base from which most of the income is derived for the OASDI program. Also of interest are estimates of income and cost expressed as shares of gross domestic product (GDP), the value of goods and services produced during the year in the United States. Under alternative II, OASDI cost generally rises from about 4.8 percent of GDP currently to 6.1 percent in 2030, and then peaks at almost 6.2 percent in 2034. Thereafter, OASDI cost as a percent of GDP is projected to decline, reaching a level around 5.8 percent for the period 2050 through 2083. Full estimates of income and cost are presented on this basis in Appendix VI.F. 2 beginning on page 182.

## 2. Comparison of Workers to Beneficiaries

The estimated OASDI cost rate is expected to rise rapidly between 2012 and 2030 primarily because the number of beneficiaries is expected to rise substantially more rapidly than the number of covered workers as the babyboom generation retires. This occurs largely because of the swings in fertility rates over time. Because the baby-boom generation had low fertility rates relative to their parents, and those low fertility rates are expected to persist, the ratio of beneficiaries to workers is expected to rise rapidly, reaching a permanently higher level after the baby-boom generation retires. After 2030, the
ratio of beneficiaries to workers rises slowly due to increasing longevity. A comparison of the numbers of covered workers and beneficiaries is shown in table IV.B2.

${ }^{\text {a }}$ Workers who are paid at some time during the year for employment on which OASDI taxes are due.
${ }^{\mathrm{b}}$ Beneficiaries with monthly benefits in current-payment status as of June 30.
Notes:

1. The number of beneficiaries does not include uninsured individuals who receive benefits under Section 228 of the Social Security Act. Costs are reimbursed from the General Fund of the Treasury for most of these individuals.
2. Historical covered worker data are subject to revision.
3. Totals do not necessarily equal the sums of rounded components.

The impact of the demographic shifts under the three alternatives on the OASDI cost rates is readily seen by considering the projected number of OASDI beneficiaries per 100 covered workers. As compared to the 2008 level of 31 beneficiaries per 100 covered workers, this ratio is estimated to rise to 46 by 2030 and 48 by 2035 under intermediate assumptions, as the growth in beneficiaries greatly exceeds the growth in workers. By 2085, this ratio rises significantly under all three alternatives, reaching 39 under the low-cost assumptions, 52 under the intermediate assumptions, and 69 under
the high-cost assumptions. The significance of these numbers can be seen by comparing figure IV.B1 to figure IV.B2.

For each alternative, the shape of the curve in figure IV.B2, which shows beneficiaries per 100 covered workers, is strikingly similar to that of the corresponding cost-rate curve in figure IV.B1, thereby emphasizing the extent to which the cost of the OASDI program as a percentage of taxable payroll is determined by the age distribution of the population. Because the cost rate is basically the product of the number of beneficiaries and their average benefit, divided by the product of the number of covered workers and their average taxable earnings (and because average benefits rise at about the same rate as average earnings), it is to be expected that the pattern of the annual cost rates is similar to that of the annual ratios of beneficiaries to workers.

Figure IV.B2.-Number of OASDI Beneficiaries Per 100 Covered Workers

Table IV.B2 also shows the number of covered workers per OASDI beneficiary, which was about 3.2 in 2008. This ratio declines under all three alternatives because it is the inverse of the ratio of beneficiaries to workers.

## 3. Trust Fund Ratios

Trust fund ratios are useful indicators of the adequacy of the financial resources of the Social Security program at any point in time. For any year in which the projected trust fund ratio is positive (i.e., the trust fund holds assets at the beginning of the year), but is not positive for the following year,

## Actuarial Estimates

the trust fund is projected to become exhausted during the year. Under present law, the OASI and DI Trust Funds do not have the authority to borrow. Therefore, exhaustion of the assets in either fund during a year would mean there are no longer sufficient assets in the fund to cover the full amount of benefits scheduled for the year under present law.

The trust fund ratio also serves an additional important purpose in assessing the actuarial status of the program. When the financing is adequate for the timely payment of full benefits throughout the long-range period, the stability of the trust fund ratio toward the end of the period indicates the likelihood that this projected adequacy will continue for subsequent Trustees Reports. If the trust fund ratio toward the end of the period is level (or increasing), then projected adequacy for the long-range period is likely to continue for subsequent reports. Under these conditions, the program financing is said to achieve sustainable solvency.

Table IV.B3 shows, by alternative, the estimated trust fund ratios (without regard to advance tax transfers that would be effected after the end of the 10-year, short-range period) for the separate and combined OASI and DI Trust Funds. Also shown in this table is the year in which a fund is estimated to become exhausted, reflecting the effect of the provision for advance tax transfers.

Based on the intermediate assumptions, the OASI trust fund ratio rises from 392 percent at the beginning of 2009, reaching a peak of 422 percent at the beginning of 2012. This increase in the OASI trust fund ratio results from the fact that the annual income rate exceeds the annual cost rate for several years (see table IV.B1). Thereafter, the OASI trust fund ratio declines steadily, with the OASI Trust Fund becoming exhausted in 2039. The DI trust fund ratio has been declining steadily since 2003, and is estimated to continue to decline from 179 percent at the beginning of 2009 until the trust fund becomes exhausted in 2020.

The trust fund ratio for the combined OASI and DI Trust Funds under the intermediate assumptions rises from 354 percent for 2009 to a peak of 369 percent at the beginning of 2012. Thereafter, the ratio declines, with the combined funds becoming exhausted in 2037. In last year's report, the peak trust fund ratio for the combined funds was estimated to be 395 percent for 2014 and the year of exhaustion was estimated to be 2041.

The trust fund ratio for the OASDI program under the intermediate assumptions first declines in 2013. This occurs because the increase in trust fund assets during 2012, which reflects interest income and a small excess of noninterest income over cost, occurs at a slower rate than does the increase in the annual cost of the program between 2012 and 2013. After 2012, the dollar
amount of assets is projected to continue to rise through the beginning of 2024 because interest income more than offsets the shortfall in noninterest income.

Beginning in 2016, the OASDI program under the intermediate assumptions is projected to experience increasingly large cash-flow shortfalls that will require the trust funds to redeem special public-debt obligations of the General Fund of the Treasury. This will differ from the experience of recent years when the trust funds have been net lenders to the General Fund of the Treasury. The change in the cash flow between the trust funds and the general fund is expected to have important public policy and economic implications that go well beyond the operation of the OASDI program itself.

Based on the low-cost assumptions, the trust fund ratio for the DI program increases from 2014 through the end of the long-range projection period, reaching the extremely high level of 1,683 percent for 2084. At the end of the long-range period, the DI trust fund ratio is rising by 33 percentage points per year. For the OASI program, the trust fund ratio rises to a peak of 451 percent for 2017, drops to a low of 261 percent for 2052, and rises thereafter to a level of 389 percent for 2084. At the end of the period, the OASI trust fund ratio is rising by 6 percentage points per year. For the OASDI program, the trust fund ratio peaks at 408 percent for 2018, falls to 301 percent for 2044, and increases thereafter, reaching 552 percent for 2084. Because the trust fund ratios are large and increasing at the end of the long-range period, subsequent Trustees Reports are likely to contain projections of adequate long-range financing of the OASI, the DI, and the combined OASI and DI programs under the low-cost assumptions. Thus, under the low-cost assumptions, each program would achieve sustainable solvency.

In contrast, under the high-cost assumptions, the OASI trust fund ratio is estimated to peak at 413 percent for 2012, thereafter declining to fund exhaustion by the end of 2031. The DI trust fund ratio is estimated to decline from 176 percent for 2009 to fund exhaustion by the end of 2016. The combined OASDI trust fund ratio is estimated to rise to a peak of 360 percent for 2011, declining thereafter to fund exhaustion by the end of 2029.

Thus, because large ultimate cost rates are projected under all but the lowcost assumptions, it is likely that income will eventually need to be increased, and/or program costs will need to be reduced in order to prevent the trust funds from becoming exhausted.

Even under the high-cost assumptions, however, the combined OASI and DI funds on hand plus their estimated future income would be able to cover their combined cost for 20 years into the future (until 2029). Under the intermediate assumptions the combined starting funds plus estimated future income

## Actuarial Estimates

would be able to cover cost for about 28 years into the future (until 2037). The program would be able to cover cost for the foreseeable future under the more optimistic low-cost assumptions. In the 2008 report, the combined trust funds were projected to become exhausted in 2031 under the high-cost assumptions and in 2041 under the intermediate assumptions.

Table IV.B3.-Trust Fund Ratios, Calendar Years 2009-85

[Assets as a percentage of annual expenditures]

## 4. Summarized Income Rates, Cost Rates, and Balances

Summarized income and cost rates, along with their components, are presented in table IV.B4 for 25 -year, 50 -year, and 75 -year valuation periods. Income rates reflect the scheduled payroll tax rates and the projected income from the taxation of scheduled benefits expressed as a percentage of taxable payroll. The current combined payroll tax rate of 12.4 percent is scheduled to remain unchanged in the future. In contrast, the projected income from taxation of benefits, expressed as a percentage of taxable payroll, is expected to generally increase throughout the long-range period for two reasons. First, benefits are rising faster than payroll. Second, the benefit-taxation threshold amounts are not indexed, so that an increasing share of beneficiaries will be paying tax on their benefits. Summarized income rates also include the starting trust fund balance. Summarized cost rates include the cost of reaching a target trust fund of 100 percent of annual cost at the end of the period in addition to the cost included in the annual cost rates.

It may be noted that the payroll tax income expressed as a percentage of taxable payroll, as shown in table IV.B4, is slightly smaller than the actual tax rates in effect for each period. This difference results from the fact that all OASDI income and cost dollar amounts presented in this report are computed on a cash basis, i.e., amounts are attributed to the year in which they are intended to be received by, or expended from, the fund, while taxable
payroll is attributed to the year in which earnings are paid. Because earnings are paid to workers before the corresponding payroll taxes are credited to the funds, payroll tax income for a particular year reflects a combination of the taxable payrolls from that year and from prior years, when payroll was smaller. Dividing payroll tax income by taxable payroll for a particular year, or period of years, will thus generally result in an income rate that is slightly less than the applicable tax rate for the period.

Summarized values for the full 75-year period are useful in analyzing the long-range adequacy of financing for the program over the period as a whole under present law and under proposed modifications to the law.

Table IV.B4 shows summarized rates for valuation periods of the first 25, the first 50 , and the entire 75 years of the long-range projection period, including the funds on hand at the start of the period and the cost of accumulating a target trust fund balance equal to 100 percent of the following year's annual cost by the end of the period. The actuarial balance for each of these three valuation periods is equal to the difference between the summarized income rate and the summarized cost rate for the corresponding period. An actuarial balance of zero for any period would indicate that estimated cost for the period could be met, on average, with a remaining trust fund balance at the end of the period equal to 100 percent of the following year's cost. A negative actuarial balance indicates that, over the period, the present value of income to the program plus the existing trust fund falls short of the present value of the cost of the program plus the cost of reaching a target trust fund balance of 1 year's cost by the end of the period. This negative balance, combined with a falling trust fund ratio, signals the likelihood of continuing cash-flow deficits, implying that the current-law level of financing is not sustainable.

The values in table IV.B4 show that the combined OASDI program is expected to operate with a positive actuarial balance over the 25 -year valuation period under only the low-cost assumptions. For the 25 -year valuation period the summarized values indicate actuarial balances of 1.18 percent of taxable payroll under the low-cost assumptions, -0.17 percent under the intermediate assumptions, and -1.81 percent under the high-cost assumptions. Thus, the program is more than adequately financed for the 25 -year valuation period under only the low-cost projections. For the 50 -year valuation period the OASDI program would have a positive actuarial balance of 0.48 percent under the low-cost assumptions, but would have deficits of 1.51 percent under the intermediate assumptions and 4.05 percent under the high-cost assumptions. Thus, the program is more than adequately financed for the 50-year valuation period under only the low-cost set of assumptions.

For the entire 75 -year valuation period, the combined OASDI program would once again have actuarial deficits except under the low-cost set of assumptions. The actuarial balance for this long-range valuation period is projected to be 0.50 percent of taxable payroll under the low-cost assumptions, -2.00 percent under the intermediate assumptions, and -5.32 percent under the high-cost assumptions.

Assuming the Trustees’ intermediate assumptions are realized, the deficit of 2.00 percent of payroll indicates that financial adequacy of the program for the next 75 years could be restored if the Social Security payroll tax rate were increased for current and future earnings from 12.40 percent (combined employee-employer shares) to 14.41 percent. Alternatively, all current and future benefits could be reduced by 13.3 percent (or there could be some combination of tax increases and benefit reductions). Changes of this magnitude would be sufficient to maintain trust fund solvency over the 75-year projection period under the intermediate assumptions.

However, large annual deficits projected under current law for the end of the long-range period, which exceed 4 percent of payroll under the intermediate assumptions (see table IV.B1), indicate that the annual cost will very likely continue to exceed tax revenues after 2083. As a result, ensuring continued adequate financing would eventually require larger changes than those needed to maintain solvency for the 75 -year period. For the infinite future, the actuarial deficit is estimated to be 3.4 percent of taxable payroll under the intermediate assumptions. This means that the projected infinite horizon shortfall could be eliminated with an immediate increase in the combined payroll tax rate from 12.4 percent to about 15.8 percent. This shortfall could also be eliminated if all current and future benefits were immediately reduced by 21.1 percent.

As may be concluded from table IV.B4, the financial condition of the DI program is substantially weaker than that of the OASI program for the first 25 years. Summarized over the full 75-year period, however, long-range deficits for the OASI and DI programs under intermediate assumptions are more similar when measured relative to the level of program costs.

Table IV.B4.-Components of Summarized Income Rates and Cost Rates, Calendar Years 2009-83

| 2009-33. | 12.38 | . 71 | 1.92 | 15.02 | 16.11 | . 71 | 16.83 | -1.81 |
| 2009-58. | 12.39 | . 85 | 1.10 | 14.34 | 18.07 | . 32 | 18.39 | -4.05 |
| 2009-83. | 12.39 | . 94 | . 85 | 14.18 | 19.32 | . 19 | 19.51 | -5.32 |

Note: Totals do not necessarily equal the sums of rounded components.

Table IV.B5 presents the components and the calculation of the long-range (75-year) actuarial balance under the intermediate assumptions. The present value of future cost less future tax income over the long-range period, minus the amount of trust fund assets at the beginning of the projection period, amounts to $\$ 5.3$ trillion for the OASDI program. This amount is referred to as the 75-year "open group unfunded obligation." The actuarial deficit (i.e., the negative of the actuarial balance) combines this unfunded obligation with the present value of the "ending target trust fund," and expresses the total as a percentage of the present value of the taxable payroll for the period. The
present value of future tax income minus cost, plus starting trust fund assets, minus the present value of the ending target trust fund amounts to $-\$ 5.7$ trillion for the OASDI program. The actuarial balance-this amount expressed as a percentage of taxable payroll for the period-is therefore -2.00 percent.

| Item | OASI | DI | OASDI |
| :---: | :---: | :---: | :---: |
| Present value as of January 1, 2009 (in billions): |  |  |  |

${ }^{\text {a }}$ The calculation of the actuarial balance includes the cost of accumulating a target trust fund balance equal to 100 percent of annual cost by the end of the period.
Note: Totals do not necessarily equal the sums of rounded components.

## 5. Additional Measures of OASDI Unfunded Obligations

As shown in the previous section, a negative actuarial balance (or an actuarial deficit) provides one measure of the unfunded obligation of the program over a period of time. Two additional measures of OASDI unfunded obligations under the intermediate assumptions are presented below.

## a. Open Group Unfunded Obligations

Consistent with practice since 1965, this report focuses on the 75-year period (from 2009 to 2083 for this report) for the evaluation of the long-run financial status of the OASDI program on an open group basis (i.e., including taxes and cost for past, current and future participants through the year 2083). Table IV.B6, in its second line, shows that the present value of the open group unfunded obligation for the program over that period is $\$ 5.3$ trillion. The open group measure indicates the adequacy of financing over the period as a whole for a program financed on a pay-as-you-go basis. On this basis, payroll taxes and scheduled benefits of all participants are included through 2083.

Table IV.B6 also presents the 75-year unfunded obligation as percentages of future OASDI taxable payroll and gross domestic product (GDP) through 2083. The 75-year unfunded obligation as a percentage of taxable payroll is less than the actuarial deficit, because it excludes the ending target trust fund value (see table IV.B5).

However, there are limitations on what can be conveyed using summarized measures alone. For example, overemphasis on summary measures (such as the actuarial balance and open group unfunded obligation) for the 75-year period can lead to incorrect perceptions and policies that fail to address financial sustainability for the more distant future. This can be addressed by considering the trend in trust fund ratios toward the end of the period (see "sustainable solvency" at the beginning of section IV.B).

Another limitation of the 75 -year summary measure is that continued, and possibly increasing, annual shortfalls after 75 years are not taken into account. In order to address this limitation, this section presents estimates of unfunded obligations that extend to the infinite horizon. The extension assumes that the current-law OASDI program and the demographic and most economic trends used for the 75 -year projection continue indefinitely. The one exception is that the ultimate assumed real-wage differential for the long-range period of 1.1 percent is increased to 1.2 percent, phased in over the 10 -year period 2084 to 2093. This change essentially maintains consistency with the assumed reduction in the growth of health care expenditures after 2083. (See the Medicare Trustees Report.) The values in table IV.B6 indicate that extending the calculations beyond 2083 adds \$9.9 (\$15.1-\$5.3) trillion in present value to the amount of the unfunded obligation estimated through 2083. That is, over the infinite horizon, the OASDI open group unfunded obligation is projected to be $\$ 15.1$ trillion. The $\$ 9.9$ trillion increment reflects a significant financing gap projected for OASDI for years after 2083. Of course, the degree of uncertainty associated with estimates beyond 2083 is substantial.

In last year's report the unfunded obligation over the infinite horizon was reported as $\$ 13.6$ trillion in present value as of January 1, 2008. The change to the later valuation date (January 1, 2009), taken alone, would increase the measured deficit by about $\$ 0.7$ trillion. In addition, the net effects of changes in data, methods, and other assumptions increased the infinite horizon unfunded obligation by approximately $\$ 0.8$ trillion. The main changes affecting the infinite horizon unfunded obligation for this report are near-term economic and disability assumptions reflecting the current economic recession, updated starting economic values, and lower ultimate mortality rates for ages 65-84. See section IV.B. 7 for details regarding changes in data, methods, and assumptions.

As noted in the previous section, the $\$ 15.1$ trillion infinite future open group unfunded obligation may also be expressed as a percentage of the taxable payroll over that period. This actuarial deficit for the infinite future is 3.4 percent of taxable payroll under the intermediate assumptions, about 0.2 percentage point higher than in last year's report. This unfunded obligation can also be expressed as a percentage of GDP over the infinite future and is 1.2 percent on that basis, about 0.1 percentage point higher than in last year's report. These relative measures of the unfunded obligation over the infinite future express its magnitude in relation to the resources that are potentially available to finance the shortfall.

Table IV.B6.-Unfunded OASDI Obligations for 1935 (Program Inception) Through the Infinite Horizon [Present values as of January 1, 2009; dollar amounts in trillions]

|  | Present value | Expressed as a percentage of future payroll and GDP |  |
| :---: | :---: | :---: | :---: |
|  |  | Taxable payroll | GDP |
| Unfunded obligation for 1935 through the infinite horizon ${ }^{\text {a }}$ | \$15.1 | 3.4 | 1.2 |
| Unfunded obligation for 1935 through 2083 ${ }^{\text {b }}$ | 5.3 | 1.9 | . 7 |

a Present value of future cost less future taxes, reduced by the amount of trust fund assets at the beginning of 2009. Expressed as percentage of payroll and GDP for the period 2009 through the infinite horizon.
${ }^{\mathrm{b}}$ Present value of future cost less future taxes through 2083, reduced by the amount of trust fund assets at the beginning of 2009. Expressed as percentage of payroll and GDP for the period 2009 through 2083.
Notes:

1. The present values of future taxable payroll for 2009-83 and for 2009 through the infinite horizon are \$282.8 trillion and \$442.3 trillion, respectively.
2. The present values of GDP for 2009-83 and for 2009 through the infinite horizon are $\$ 788.4$ trillion and $\$ 1,309.0$ trillion, respectively. Present values of GDP shown in the Medicare Trustees Report differ slightly due to the use of interest discount rates that are specific to each program's trust fund holdings.

## b. Unfunded Obligations for Past, Current, and Future Participants

The future unfunded obligation of the OASDI program may also be viewed from a generational perspective. This perspective is generally associated with assessment of the financial condition of a program that is intended or required to be financed on a fully-advance-funded basis. However, analysis from this perspective can also provide insights into the implications of pay-as-you-go financing, the basis that has been used for the OASDI program.

The first line of table IV.B7 shows that the present value of future cost less future taxes over the next 100 years for all current participants equals $\$ 18.7$ trillion. For this purpose, current participants are defined as individuals who attain age 15 or older in 2009. Subtracting the current value of the trust fund (the accumulated value of past OASDI taxes less cost) gives a closed group (excluding all future participants) unfunded obligation of $\$ 16.3$ trillion. This value represents the shortfall of lifetime contributions for all past and current participants relative to the lifetime costs associated with

## Actuarial Estimates

their generations. For a fully-advance-funded program this value would be equal to zero.

For Social Security benefits to be adequately financed for the infinite future, the scheduled taxes or benefits of current and future participants in the system must be adjusted to fully offset the shortfall due to past and current participants. Future participants, as a whole, are projected to pay taxes that are approximately $\$ 1.2$ trillion more in present value than the cost of providing benefits they are scheduled to receive over the infinite future.

The remaining long run financing gap that program reforms must ultimately close for the infinite future is estimated to be $\$ 15.1$ trillion in present value. Closing this gap can be achieved by raising additional revenue or reducing benefits (or some combination) for current and future participants so that the present value of the additional revenue or reduced benefits for the infinite future is equivalent to about 3.4 percent of taxable payroll or 1.2 percent of GDP.

Table IV.B7.-Present Values of OASDI Cost Less Tax Revenue and Unfunded
Obligations for Program Participants
[Present values as of January 1, 2009; dollar amounts in trillions]

|  | Present value | Expressed as a percentage of future payroll and GDP |  |
| :---: | :---: | :---: | :---: |
|  |  | Taxable payroll | GDP |
| Present value of future cost less future taxes for current participants | \$18.7 | 4.2 | 1.4 |
| Less current trust fund (tax accumulations minus expenditures to date for past and current participants) | 2.4 | . 5 | . 2 |
| Equals unfunded obligation for past and current participants ${ }^{\text {a }}$ | 16.3 | 3.7 | 1.2 |
| Plus present value of cost less taxes for future participants for the infinite future | -1.2 | -. 3 | -. 1 |
| Equals unfunded obligation for all participants through the infinite horizon. | 15.1 | 3.4 | 1.2 |

${ }^{\text {a }}$ This concept is also referred to as the closed group unfunded obligation.
Notes:

1. The present value of future taxable payroll for 2009 through the infinite horizon is $\$ 442.3$ trillion.
2. The present value of GDP for 2009 through the infinite horizon is $\$ 1,309.0$ trillion
3. Totals do not necessarily equal the sums of rounded components.

## 6. Test of Long-Range Close Actuarial Balance

The test of long-range close actuarial balance applies to a set of 66 separate valuation periods beginning with the first 10 -year period, and including the periods of the first 11 years, the first 12 years, etc., up through the full 75 -year projection period. Under the long-range test, the summarized income rate and cost rate are calculated for each of these valuation periods. The long-range test is met if, for each of the 66 valuation periods, the actuarial balance is not less than zero or is negative by, at most, a specified percentage of the summarized cost rate for the same time period. The percentage
allowed for a negative actuarial balance is 5 percent for the full 75 -year period. For shorter periods, the allowable percentage begins with zero for the first 10 years and increases uniformly for longer periods, until it reaches the maximum percentage of 5 percent allowed for the 75 -year period. The criterion for meeting the test is less stringent for the longer periods in recognition of the greater uncertainty associated with estimates for more distant years.

When a negative actuarial balance in excess of the allowable percentage of the summarized cost rate is projected for one or more of the 66 separate valuation periods, the program fails the test of long-range close actuarial balance. Being out of close actuarial balance indicates that the program is expected to experience financial problems in the future and that ways of improving the financial status of the program should be considered. The sooner the actuarial balance is less than the minimum allowable balance, expressed as a percentage of the summarized cost rate, the more urgent is the need for corrective action. Necessary changes in program financing or benefit provisions should not be put off until the last possible moment if future beneficiaries and workers are to effectively plan for their retirement.

Table IV.B8 presents a comparison of the estimated actuarial balances with the minimum allowable balance (or maximum allowable deficit) under the long-range test, each expressed as a percentage of the summarized cost rate, based on the intermediate estimates. Values are shown for only 14 of the valuation periods: those of length 10 years, 15 years, and continuing in 5 -year increments through 75 years. However, each of the 66 periods-those of length 10 years, 11 years, and continuing in 1 -year increments through 75 years-is considered for the test. These minimum allowable balances are calculated to show the limit for each valuation period resulting from the graduated tolerance scale. The patterns in the estimated balances as a percentage of the summarized cost rates, as well as that for the minimum allowable balance, are presented graphically in figure IV.B4 for the OASI, DI and combined OASDI programs. Values shown for the $25-$ year, 50 -year, and 75 -year valuation periods correspond to those presented in table IV.B4.

For the OASI program, the estimated actuarial balance as a percentage of the summarized cost rate exceeds the minimum allowable for valuation periods of length 10 through 27 years under the intermediate estimates. For valuation periods of length greater than 27 years, the estimated actuarial balance is less than the minimum allowable. For the full 75 -year long-range period the estimated actuarial balance reaches -12.23 percent of the summarized cost rate, for a shortfall of 7.23 percent from the minimum allowable balance of -5.0 percent of the summarized cost rate. Thus, although the OASI program satisfies the test of short-range financial adequacy (as discussed earlier on page 34), it is not in long-range close actuarial balance.

For the DI program, under the intermediate assumptions, the estimated actuarial balance as a percentage of the summarized cost rate is less than the minimum allowable balance for all 66 valuation periods. For the full 75 -year long-range period the estimated actuarial balance reaches -14.14 percent of the summarized cost rate, for a shortfall of 9.14 percent from the minimum allowable balance of -5.0 percent of the summarized cost rate. Thus, the DI program fails to meet the short-range test of financial adequacy (as discussed on page 40), and is also not in long-range close actuarial balance.

Financing for the DI program is much less adequate than for the OASI program in satisfying the test for long-range actuarial balance even though longrange actuarial deficits are more comparable over the entire 75 -year period. This difference occurs because much more of the increase in the long-range cost due to the aging of the baby-boom generation occurs earlier for the DI program than for the OASI program. As a result, tax rates that are relatively more adequate for the OASI program during the first 25 years become relatively less adequate later in the long-range period.
For the OASDI program, the estimated actuarial balance as a percentage of the summarized cost rate exceeds the minimum allowable balance for valuation periods of length 10 through 25 years under the intermediate estimates. For valuation periods of length greater than 25 years, the estimated actuarial balance is below the minimum allowable balance. The size of the shortfall from the minimum allowable balance rises gradually, reaching 7.50 percent of the summarized cost rate for the full 75-year long-range valuation period. Thus, although the OASDI program satisfies the short-range test of financial adequacy, it is out of long-range close actuarial balance.
The OASI and DI programs, both separate and combined, were also found to be out of close actuarial balance in last year's report. The estimated deficits for the OASI, DI, and combined OASDI programs in this report are worse when compared to those shown in last year's report for the longer valuation periods.

Table IV.B8.-Comparison of Long-Range Actuarial Balances With the Minimum Allowable in the Test for Close Actuarial Balance, Based on Intermediate Assumptions

| Valuation period | Rates(percentage of taxable payroll) |  |  | Values expressed as a percentage of cost rate |  |
| :---: | :---: | :---: | :---: | :---: | :---: |

${ }^{a}$ In changing from the valuation period of last year's report, which was 2008-82, to the valuation period of this report, 2009-83, the relatively large negative annual balance for 2083 is included. This results in a larger long-range actuarial deficit. The fund balance at the end of 2008, i.e., at the beginning of the projection period, is included in the 75-year actuarial balance.
Note: Totals do not necessarily equal the sums of rounded components.
Since the last report, one law that affects the financing of the OASDI program, the Food, Conservation, and Energy Act of 2008, was enacted (see section III.B). The effect of this law is estimated to increase the long-range OASDI actuarial balance by a negligible amount (less than 0.005 percent of taxable payroll). In addition, the Congress has enacted legislation to stabilize the banking system and to stimulate the economy. The Emergency Economic Stabilization Act of 2008 allows the government to purchase troubled assets and stocks to strengthen financial institutions. The American Recovery and Reinvestment Act of 2009 includes some reductions in personal income taxes and increases in government expenditures. These policies are expected to affect the speed and timing of the economic recovery from the current recession. The short-range economic assumptions used for this report reflect these effects.
In changing from the valuation period of last year's report, which was 200882, to the valuation period of this report, 2009-83, the relatively large negative annual balance for 2083 is included. This results in a decrease (worsening) in the long-range OASDI actuarial balance of 0.05 percent of taxable payroll. (Note that the trust fund assets at the end of 2008, i.e., at the beginning of the projection period, are included in the 75 -year actuarial balance. These assets reflect the net financial flows for the program for all past years. Hence the valuation periods for the 2008 and 2009 Trustees Reports could be referred to as 1937-2082 and 1937-2083, respectively.)

Changes in the demographic starting values and assumptions reduce the long-range OASDI actuarial balance by 0.11 percent of taxable payroll. First, the source of change contributing most to this reduction is the revision of ultimate rates of decline in mortality. The most significant of these revisions are faster ultimate rates of decline in death rates for heart disease and cancer for ages 65-84. In addition, final mortality data for 2005 result in slightly lower starting death rates and faster near-term declines in death rates than in last year's report. All of the mortality changes result in a decrease in the long-range OASDI actuarial balance of about 0.12 percent of taxable payroll. Second, immigration levels for the first several years of the projection period are assumed to be slightly lower than the levels in last year's report, reflecting both a lower starting level of immigration and the weaker economy during the recession and recovery period. These lower levels result in a decrease in the long-range OASDI actuarial balance of about 0.01 percent of taxable payroll. Third, partially offsetting the effect of the mortality and immigration changes are higher assumed birth rates during the first 24 years of the projection period. This revision stems from preliminary birth data for 2006 that indicate higher than expected numbers of births, and results in an increase in the long-range OASDI actuarial balance of about 0.02 percent of taxable payroll.

Ultimate economic assumptions are unchanged from those in last year's report. However, changes in starting values and in the near-term economic growth assumptions significantly reduce the long-range OASDI actuarial balance by about 0.15 percent of taxable payroll. The projections begin with an economic recession where negative real GDP growth that started in the third calendar quarter of 2008 is assumed to continue though the second quarter of 2009. The recovery from the recession is projected to extend through 2015. During the period of negative real GDP growth and the period of recovery, unemployment rates are higher than the assumed ultimate level and higher than projected in last year's report. Reduced employment during these periods leads to significantly less payroll taxes, resulting in smaller trust fund accumulations. For 2017 and later, real GDP is projected to be about 1.4 percent lower than in the 2008 report, based on recent data and the effects of the recession. Reduced average benefit levels resulting from the recession only partly offset the effects on revenue. Based on recent experience, interest rates for new special-issue Treasury bonds are assumed to be lower through 2012 than in last year's report.

Several changes in disability assumptions and data are included in this report and combine to decrease the long-range OASDI actuarial balance by 0.01 percent of taxable payroll. First, disability incidence rates are substantially higher in the first few years of the projection period as more individuals are assumed to apply for disability benefits due to the economic recession. These
increased incidence rates reduce the long-range OASDI actuarial balance by 0.02 percent of taxable payroll. Second, the disability incidence rate assumptions are slightly increased to reflect the agency's decision that certain policies currently applying only in the Boston region (in particular, the policy to close a disability claimant's record to new evidence after a determination for an initial appeal to an administrative law judge) would not be extended to other regions. This decision reduces the long-range OASDI actuarial balance by 0.01 percent of taxable payroll. Third, the ultimate disability incidence rates and the disability-insured population are updated to reflect more recent historical data and trends (other than the recession), resulting in an improvement in the actuarial balance of 0.02 percent of taxable payroll.

Several methodological improvements and updates of program-specific data are included in this report. These changes to programmatic data and methods have largely offsetting effects and combine to increase the long-range OASDI actuarial balance by 0.03 percent of taxable payroll.

Three significant changes were made in the methods for determining average benefit amounts for retired-worker and disabled-worker beneficiaries for projection years 11 through 75 . First, the factors used to project growth in benefit levels after initial entitlement in excess of the COLA (due to additional earnings and lower mortality for higher earners) were updated, reflecting recent data. Second, post-entitlement factors were newly developed and applied for the following additional beneficiary categories: (1) retiredworker beneficiaries after conversion from disabled-worker status at normal retirement age; (2) retired-worker beneficiaries over age 95; and (3) dis-abled-worker beneficiaries. Third, the transitioning of projected average benefit levels, from the end of the 10-year short-range period to the remainder of the long-range period, was improved. These three changes combined to increase the projected average benefit level for disabled-worker beneficiaries and decrease the projected average benefit level for retired-worker beneficiaries over the long-range projection period. As a result, the long-range OASI actuarial balance decreased by 0.05 percent of taxable payroll, and the longrange DI actuarial balance increased by a similar amount. In total, the combined effects increased the long-range OASDI actuarial balance by 0.01 percent of taxable payroll.

Three additional significant changes were made in the area of methodological improvements and updates of program-specific data. First, the ultimate projected relationship between benefits and personal income taxes on OASDI benefits was updated based on new estimates provided by the Office of Tax Analysis at the Department of the Treasury. The revisions in the estimates of tax revenue increase the long-range OASDI actuarial balance by 0.02 percent of taxable payroll. Second, the methodology for projecting the

## Actuarial Estimates

financial interchange between the Social Security Administration and the Railroad Retirement Board (RRB) was improved by using data and projections provided directly from the RRB. The improvement in the methodology of RRB estimates decreases the long-range OASDI actuarial balance by 0.01 percent of taxable payroll. Third, starting level data and estimates were revised for retroactive payments to beneficiaries for periods of benefit entitlement prior to award; plus estimates of the effect of the windfall elimination provision for individuals with pensions based on non-OASDI-covered employment were revised. These final updates, and other improvements based on more recent historical information, result in an increase in the longrange OASDI actuarial balance of about 0.01 percent of taxable payroll.

If no changes in assumptions or methods were made for this report and actual experience had met expectations since the last report, the OASDI long-range actuarial deficit would have increased by 0.05 percent of taxable payroll due to the change in the valuation period. However, the combined changes made in data, assumptions, and methods for this report increase the actuarial deficit by an additional 0.25 percent of taxable payroll. Thus the actuarial deficit increases from 1.70 percent in last year's report to 2.00 percent of taxable payroll in this report.

The effects of changes made in this report can also be illustrated by comparing the annual (cash-flow) balances for this and the prior year's report. Figure IV.B5 provides this comparison for the combined OASDI program over the long-range (75-year) projection period.

Figure IV.B5.-OASDI Annual Balances: 2008 and 2009 Trustees Reports [As a percentage of taxable payroll under the intermediate assumptions]

During the first 10 years of the projection period, the annual balances in this report are lower than those in last year's report by about 0.52 percent of taxable payroll, on average. This is mainly due to (1) a lower starting level of real GDP than was assumed last year for 2008, and (2) the economic recession which is projected to cause a decline in income from payroll taxes and an increase in the number of disabled-worker beneficiaries. After 2018, the difference in projected annual balances between the two reports increases through about 2025 due to the improved method for transitioning projected average benefit levels from the short-range period to the long-range period. The effect of generally lower post-entitlement factors then causes the difference to decline, reaching similar annual balances around 2063. Thereafter, the projected annual balances in this year's report gradually become lower than in last year's report due primarily to the increase in assumed rates of decline in mortality. By the end of last year's 75 -year projection period (2082), the difference in the annual balances is 0.09 percent of payroll. The annual deficit for 2082 is 4.29 percent of taxable payroll in this report compared to 4.20 percent for 2082 in last year's report.

## V. ASSUMPTIONS AND METHODS UNDERLYING ACTUARIAL ESTIMATES

The future income and cost of the OASDI program will depend on many demographic, economic, and program-specific factors. Trust fund income will depend on how these factors affect the size and composition of the working population and the level and distribution of earnings. Similarly, program cost will depend on how these factors affect the size and composition of the beneficiary population and the general level of benefits.

Basic assumptions are developed for several of these factors based on analysis of historical trends and conditions, and on expected future conditions. These factors include fertility, mortality, immigration, marriage, divorce, productivity, inflation, average earnings, unemployment, retirement, and disability incidence and termination. Other factors are projected using methods that reflect historical and expected future relationships to the basic assumptions. These include total population, life expectancy, labor force, gross domestic product, interest rates, and many program-specific factors. It should be noted that all factors included in any consistent set of assumptions are interrelated directly or indirectly. It is also important to note that these interrelationships can and do change over time.

The assumptions and methods used in this report are reexamined each year in light of recent experience and new information about future conditions, and are revised if warranted.

Because projections of these factors and their interrelationships are inherently uncertain, a range of estimates is shown in this report on the basis of three sets of assumptions, designated as intermediate (alternative II), lowcost (alternative I), and high-cost (alternative III). The intermediate set represents the Board's best estimate of the future course of the population and the economy. In terms of the net effect on the status of the OASDI program, the low-cost is more optimistic, and the high-cost is more pessimistic. The lowand high-cost sets of assumptions reflect significant potential changes in the interrelationship among factors, as well as changes in the values for individual factors. The probability is very low that all the factors and interactions would differ in the same direction from those expected for long periods of time. Outcomes with overall long-range cost as low as (or lower than) the low-cost scenario or as high as (or higher than) the high-cost scenario also have a very low probability. This report also includes a stochastic projection that provides a probability distribution of possible future outcomes that is centered around the intermediate assumptions. These are discussed in Appendix E.

Although these three sets of demographic and economic assumptions have been developed to provide a broad range of possible outcomes, the resulting estimates should be interpreted with care. The estimates are not intended to be specific predictions of the future financial status of the OASDI program, but rather, they are intended to be indicators of the expected trend and a reasonable range of future income and cost, under a variety of plausible demographic and economic conditions.

The values for each of the demographic, economic, and program-specific factors are assumed to move from recently experienced levels or trends, toward long-range ultimate values, generally over the next 25 years. Ultimate values or trends reached by the end of the 75 -year long-range period are generally maintained at these levels or trends for extrapolations beyond 75 years. One exception is for real-wage growth, as described in section IV.B.5.

The assumed ultimate values, which are reached within the first 25 years (and apply thereafter through the end of the 75-year long-range period) for both the demographic and the economic factors, are intended to represent average annual experience or growth rates. Actual future values will exhibit fluctuations or cyclical patterns, as in the past.

The following sections discuss, in abbreviated form, the various assumptions and methods required to make the estimates of trust fund financial status, which are the heart of this report. ${ }^{1}$ There are, of course, many interrelationships among these factors that make a sequential presentation potentially misleading. Nevertheless, the following sections roughly follow the order used in building the trust fund estimates presented in chapter IV.

## A. DEMOGRAPHIC ASSUMPTIONS AND METHODS

The principal demographic assumptions relating to fertility, mortality, and net immigration for the three alternatives are shown in table V.A1. The rationales for selecting these assumptions are discussed in the following three sections.

[^7]
## Assumptions \& Methods

## 1. Fertility Assumptions

Fertility assumptions are developed for women in the form of birth rates by single year of age, from 14 to 49. They are applied to the total number of women in the population at each age, for all marital statuses.

Historically, birth rates in the United States have fluctuated widely. The total fertility rate ${ }^{1}$ decreased from 3.31 children per woman at the end of World War I (1918) to 2.15 during the Great Depression (1936). After 1936, the total fertility rate rose to 3.68 in 1957 and then fell to 1.74 by 1976. After 1976, the total fertility rate began to rise again, reaching a level of 2.07 for 1990. In the 1990s, the total fertility rate remained fairly stable, around 2.00 children per woman. Since 2000, the total fertility rate has been consistently above 2.00, and was 2.06 in 2005.

These variations in the total fertility rate resulted from changes in many factors, including social attitudes, economic conditions, and the use of birthcontrol methods. Future total fertility rates may be expected to remain close to recent levels. Certain population characteristics, such as the higher percentages of women who have never married, of women who are divorced, and of young women who are in the labor force, are consistent with continued lower total fertility rates than experienced during the baby-boom era (1946-65). Based on consideration of these factors, ultimate total fertility rates of $2.30,2.00$ and 1.70 children per woman are assumed for the lowcost, intermediate, and high-cost assumptions, respectively. These assumptions are unchanged from those used in last year's report.

Based on preliminary data for 2006 and 2007, the total fertility rate is assumed to reach a level of 2.10 children per woman for both 2006 and 2007 and 2.08 for 2008. These levels are slightly higher than those estimated in last year's report for the intermediate assumptions. For all three alternatives, the total fertility rate is then assumed to follow a gradual trend toward the selected ultimate level, which is reached in 2033.

## 2. Mortality Assumptions

For the projections in this year's report, assumed average percentage reductions in future mortality rates were developed by age-group, sex, and cause of death. These assumptions were then used to estimate future central death

[^8]rates by age-group, sex, and cause of death. From these estimated central death rates, resulting probabilities of death by single year of age and sex were calculated.

Historical death rates (for years 1900-2005) used in developing estimates for this report were calculated for ages below 65 (and for all ages for years prior to 1968) using data from the National Center for Health Statistics (NCHS). ${ }^{1}$ For ages 65 and over, final Medicare data on deaths and enrollments were used for years 1968 through 2005. Death rates by cause of death at all ages, for years 1979-2005, were produced by the NCHS.

The total age-sex-adjusted death rate ${ }^{2}$ declined at an average rate ${ }^{3}$ of 1.07 percent per year between 1900 and 2005. Between 1979 and 2005, the period for which death rates were analyzed by cause, the total age-sexadjusted death rate (for all causes combined) declined at an average rate of 0.82 percent per year.

Death rates have declined substantially in the U.S. since 1900, with rapid declines over some periods and slow or no improvement over the other periods. Historical death rates generally declined more slowly for older ages than for the rest of the population. The age-sex-adjusted death rate for ages 65 and over declined at an average rate of 0.75 percent per year between 1900 and 2005. Between 1982 and 2005 the age-sex-adjusted death rate for these ages declined at an average annual rate of 0.57 percent.

Reductions in death rates resulted from many factors, including increased medical knowledge and availability of health-care services, and improvements in sanitation and nutrition. Based on consideration of the expected rate of future progress in these and other areas, three alternative sets of ultimate annual percentage reductions in central death rates by age group, sex, and cause of death are assumed for 2033 and later. The intermediate set, which is used for alternative II, is considered to be the most likely to occur. The average annual percentage reductions used for alternative I are generally smaller than those for alternative II, while those used for alternative III are generally larger. These three sets of ultimate annual percentage reductions differ slightly from those used in last year's report. Overall, age-sex-adjusted death rates are projected to decline slightly faster than in last year's report. The dif-

[^9]
## Assumptions \& Methods

ferences reflect an assessment of long-term trends based on mortality data from 1900 through 2005. The most significant changes in the ultimate rates of reduction in death rates are increases in these rates for heart disease and cancer between ages 65-84. For these ages and these causes of death, declines in death rates have consistently exceeded expectations in recent years.

After 2005, the reductions in central death rates for alternative II are assumed to change rapidly from the average annual reductions by age group, sex, and cause of death observed between 1985 and 2005, to the ultimate annual percentage reductions by age group, sex, and cause of death assumed for 2033 and later. The reductions in death rates under alternatives I and III are also assumed to change rapidly to their ultimate levels, but start from levels which are, respectively, 50 or 150 percent of the average annual reductions observed between 1985 and 2005.

Projections of age-sex-adjusted death rates are presented in table V.A1 for the total population (all ages), for under age 65, and for ages 65 and over. Under the intermediate assumptions, projected age-sex-adjusted death rates for the total population are lower than the death rates in last year's report. However, for the age group under age 65, projected age-sex-adjusted death rates are slightly higher than in last year's report. This change primarily results from updating starting levels of mortality to reflect the most recent data. For the age group 65 and over, projected age-sex-adjusted death rates are lower than in last year's report. This is primarily due to the increased ultimate rates of decline in mortality that are assumed for ages 65 through 84.

After adjustment for changes in the age-sex distribution of the population, the resulting total death rates are projected to decline at ultimate average annual rates of about 0.35 percent, 0.77 percent, and 1.24 percent between 2033 and 2083 for alternatives I, II, and III, respectively. In keeping with the patterns observed in the historical data, future rates of decline are assumed to be greater for younger ages than for older ages, but to a substantially lesser degree than in the past. Accordingly, age-sex-adjusted death rates for ages 65 and over are projected to decline at average annual rates of about 0.32 percent, 0.71 percent, and 1.18 percent between 2033 and 2083 for alternatives I, II, and III, respectively.

Experts express a wide range of views on the likely rate of future decline in death rates. For example, the 2007 Technical Panel on Assumptions and Methods appointed by the Social Security Advisory Board believed that ultimate rates of decline in mortality will be higher than the rates of decline assumed for the intermediate projections in this report. Others believe that
biological and social factors may slow future rates of decline in mortality. Evolving mortality trends and developments in health care and lifestyle will be closely monitored to determine what further modifications to the assumed ultimate rates of decline in mortality may be warranted for future reports.

## 3. Immigration Assumptions

In order to develop projections of the total Social Security area population, assumptions are made for annual legal immigration, legal emigration, other immigration, and other emigration. Legal immigration consists of persons who are granted legal permanent resident (LPR) status. Legal emigration consists of those legal immigrants and native-born citizens who leave the Social Security area population. Net legal immigration is then calculated as the difference between legal immigration and legal emigration. Other immigration consists of immigrants who enter the Social Security area in a given year and stay to the end of that year without having LPR status, such as undocumented immigrants and temporary foreign workers and students. Other emigration consists of other immigrants who leave the Social Security area population or who adjust their status to LPR. Net other immigration is then calculated as the difference between other immigration and other emigration. Net immigration refers to the sum of net legal immigration and net other immigration.

Separate assumptions are developed for the low-cost, intermediate, and highcost scenarios. The low-cost scenario includes higher annual net immigration and the high-cost scenario includes lower annual net immigration.

Legal immigration increased after World War II to around 300,000 persons per year and remained around that level until shortly after 1960. With the Immigration Act of 1965 and other related changes, annual legal immigration increased to about 400,000 and remained fairly stable until 1977. Between 1977 and 1990, legal immigration once again increased, averaging about 580,000 ${ }^{1}$ per year. The Immigration Act of 1990, which took effect in fiscal year 1992, restructured the immigration categories and increased significantly the number of immigrants who may legally enter the United States.

Legal immigration averaged about $790,000^{1}$ persons per year during the period 1992 through 2000. Legal immigration increased to about 900,000 in 2000 and about 1,000,000 in 2001 reflecting primarily an increase in the number of persons granted LPR status as immediate relatives of U.S. citi-

[^10]
## Assumptions \& Methods

zens, the only category of legal immigration that is not numerically limited. However, legal immigration declined to less than 800,000 by 2003 as the number of pending applications increased. From 2003 to 2006, legal immigration increased, reaching about 1,200,000 for 2005 and 2006. For 2007, legal immigration decreased to about 1,100,000. Legal immigration in excess of $1,000,000$ reflects the concerted effort in recent years to reduce the backlog of pending applications for LPR status.

For the intermediate alternative, the remaining backlog of pending applications is assumed to be reduced by the end of 2009, and thereafter legal immigration is assumed to average approximately $1,000,000$ persons per year. For alternatives I and III, annual legal immigration is ultimately assumed to be $1,200,000$ persons and 800,000 persons, respectively. These are the same assumptions used in the 2008 report.

The ratios of annual legal emigration to legal immigration are assumed to be 20 , 25 , and 30 percent for alternatives I, II, and III, respectively. This range is consistent with the limited historical data for legal emigration from the Social Security area. These are the same ratios used in the 2008 Trustees Report. Combining the annual legal immigration and emigration assumptions results in ultimate net legal immigration of 750,000 persons per year under the intermediate alternative. For the low-cost and high-cost scenarios, ultimate annual net legal immigration is 960,000 persons and 560,000 persons, respectively.

The number of other immigrants residing in the Social Security area population is estimated to have been about 9.7 million persons as of January 1, 2000, increasing to about 12.8 million persons as of January 1, 2006. This other-immigrant population is highly mobile and far more likely to leave the Social Security area than is the native-born or legal-immigrant population. The average number of persons entering the other-immigrant population in the period 2000 through 2006 is estimated to have been about 1.5 million per year. During the same period, the number of other immigrants who left the Social Security area or adjusted status to become LPRs is estimated to have averaged about 960,000 per year. Thus, annual net other immigration during this time period is estimated to have averaged approximately 540,000 persons.

For the intermediate assumptions, annual other immigration is assumed to continue at the level of 1.5 million persons throughout the projection period. For the low- and high-cost scenarios, future annual other immigration is assumed to average 1.8 million persons and 1.2 million persons, respectively.

Emigration from the other-immigrant population includes those who leave the Social Security area and those who adjust status to become LPRs. The annual number of other immigrants who leave the Social Security area is estimated based on modeled departures, disaggregated into two groups, for the period 2000-06. The first departing group is set at fixed annual numbers of departures, by age and sex, which remain constant throughout the projection period. This first group is directly related to the number of other immigrants that are assumed to have recently entered the Social Security area. The second departing group is calculated by applying a set of annual departure rates, by age and sex, to the other-immigrant population in the Social Security area. In addition, the annual number of other immigrants who adjust status to become LPRs is assumed to ultimately be 500,000 for the intermediate assumptions. This level is one third of the annual number of other immigrants assumed to enter the Social Security area. For the low- and high-cost scenarios, ultimate annual numbers adjusting status to LPR are assumed to average 600,000 persons and 400,000 persons, respectively.

Under the assumptions and methods described above, the size of the otherimmigrant population is projected to grow substantially. This growth reflects the excess of annual other immigration over the combined annual numbers of emigrants and deaths that occur within the other-immigrant population.

Net other immigration decreased from a level averaging over 590,000 per year in the period 2000 through 2003, to about 465,000 in 2006, reflecting an increase in the number of other immigrants adjusting to LPR status as a result of the effort to reduce the backlog of applications for LPR status. By 2010, when the backlog of applications is expected to be eliminated, net other immigration is projected to be about 440,000 persons per year. After 2010, net other immigration is projected to decline steadily to about 275,000 in 2063 and to remain fairly stable thereafter. The decline in net other immigration is attributable to the increasing number of other immigrants residing in the Social Security area. This results in an increase in the numbers who emigrate out of the area based on the rates of departure described above. All other components of other immigration and emigration are set at fixed levels after 2010, and thus do not contribute toward any change in net other immigration. The average annual level of net other immigration over the 75-year projection period is about 315,000 persons. Net other immigration is estimated to average about 410,000 persons per year under the low-cost assumptions and 220,000 persons per year under the high-cost assumptions.

The total level of net immigration (legal and other combined) is estimated to average 1,065,000 persons per year during the 75 -year projection period under the intermediate assumptions. For the low-cost assumptions, total net

## Assumptions \& Methods

immigration is estimated to average 1,370,000 persons per year. Under the high-cost assumptions, total net immigration is estimated to average 785,000 persons per year.

Demographers express a wide range of views about the future course of immigration for the United States. Some, like the 2007 Technical Panel mentioned in the previous section, believe that immigration will increase substantially in the future. Others believe that potential immigrants may be attracted to other countries or that the U.S. borders could be tightened in the future.

${ }^{\text {a }}$ The total fertility rate for any year is the average number of children who would be born to a woman in her lifetime if she were to experience the birth rates by age observed in, or assumed for, the selected year, and if she were to survive the entire childbearing period. The ultimate total fertility rate is assumed to be reached in 2033.
${ }^{\mathrm{b}}$ The age-sex-adjusted death rate is the crude rate that would occur in the enumerated total population as of April 1, 2000, if that population were to experience the death rates by age and sex observed in, or assumed for, the selected year.
${ }^{\text {c }}$ Net immigration values are rounded to the nearest 5,000 .
${ }^{\mathrm{d}}$ Historical estimates of net legal immigration assume a 25 percent reduction in legal immigration due to legal emigration. Estimates do not include persons legalized under the Immigration Reform and Control Act of 1986.
${ }^{\text {e }}$ Net other annual immigration is estimated to have averaged 375,000 persons over the period 1980-89 and 550,000 persons over the period 1990-99.
${ }^{\mathrm{f}}$ Estimated.

## 4. Total Population Estimates

Combining the above assumptions for future fertility, mortality, and net immigration with assumptions on marriage and divorce based on data from the NCHS, projections were made of the population in the Social Security
area by age, sex, and marital status as of January 1 of each year 2008 through 2085. The starting Social Security area population for January 1, 2007, is based on the Census Bureau's estimate of the residents of the 50 States and D.C., and U.S. Armed Forces overseas. The base estimate is adjusted for net census undercount and increased for other U.S. citizens living abroad (including residents of U.S. territories) and for non-citizens living abroad who are insured for Social Security benefits. This starting population was then projected using assumed rates of birth, death, marriage and divorce, and assumed levels of net immigration.

Table V.A2 shows the historical and projected population as of July 1 by broad age group, for the three alternatives. Also shown are aged and total dependency ratios (see table footnotes for definitions).

${ }^{\text {a }}$ Ratio of the population at ages 65 and over to the population at ages 20-64.
${ }^{\mathrm{b}}$ Ratio of the population at ages 65 and over and the population under age 20 to the population at ages 20-64.
${ }^{\text {c }}$ Estimated.
Notes:

1. Historical data are subject to revision.
2. Totals do not necessarily equal the sums of rounded components.

## 5. Life Expectancy Estimates

Life expectancy, or average remaining number of years expected prior to death, is a useful analytical concept. Life expectancy is calculated in two different forms, for two separate purposes.

Period life expectancy is calculated for a given year using the actual or expected death rates at each age for that year. It is a useful summary statistic for illustrating the overall level of the death rates experienced in a single year. It is thus closely related to the age-sex-adjusted death rate that is discussed in section V.A.2. Period life expectancy for a particular year may be viewed as the expected remaining life at a selected age only if it is assumed that there is no change in death rates after that year.

Cohort life expectancy truly answers the question "What is the expected average remaining lifetime for an individual at a selected age in a given year?" Cohort life expectancy is calculated using death rates not from a single year, but from the series of years in which the individual will actually reach each succeeding age if he or she survives. Cohort life expectancy is shown in table V.A4 for those born on January 1 of each calendar year, and for those attaining age 65 on January 1 of each calendar year.

Tables V.A3 and V.A4 present historical and projected life expectancy calculated on both period and cohort bases. Cohort life expectancy is somewhat greater than period life expectancy for the same year. This is because death rates for any given age tend to decline as time passes and the cohort grows older.

## Assumptions \& Methods

| 2075 | 81.0 | 84.4 | 18.9 | 21.0 | 86.7 | 89.7 | 21.7 | 23.8 | 93.0 | 95.4 | 25.4 | 27.4 |
| 2080 | 81.1 | 84.6 | 19.0 | 21.1 | 87.0 | 90.0 | 21.9 | 24.1 | 93.4 | 95.8 | 25.8 | 27.7 |
| 2085 | 81.3 | 84.7 | 19.2 | 21.3 | 87.2 | 90.2 | 22.2 | 24.3 | 93.8 | 96.1 | 26.1 | 28.1 |

${ }^{\text {a }}$ The cohort life expectancy at a given age for a given year represents the average number of years of life remaining if a group of persons at that age were to experience the mortality rates for the series of years in which they reach each succeeding age.
${ }^{\mathrm{b}}$ Cohort life expectancy at birth for those born on January 1 of the calendar year is based on a combination of actual and estimated death rates for birth years 1940 through 2005. For birth years after 2005, these values are based solely on estimated death rates.
${ }^{\text {c }}$ Age 65 cohort life expectancy for those attaining age 65 on January 1 of the calendar years before 1975 is based on actual data. For 1975 through 2005, these values are based on a combination of actual and estimated death rates. After 2005, these values are based solely on estimated death rates.

## B. ECONOMIC ASSUMPTIONS AND METHODS

The basic economic assumptions are embodied in three alternatives that are designed to provide a reasonable range of effects on Social Security's financial status. The intermediate assumptions reflect the Trustees' consensus expectation of an underlying general trend toward moderate economic growth throughout the projection period and the expected levels of various economic parameters. The low-cost assumptions represent a more optimistic outlook and assume relatively strong economic growth and relatively optimistic levels for other parameters. The high-cost assumptions represent a relatively pessimistic scenario, with weak economic growth, two recessions in the short-range period and relatively pessimistic levels for other parameters. For this report, all three sets of assumptions include an extension into the projection period of the recession that started in December 2007 with lower productivity in 2009 and unemployment peaking in 2010.

Actual economic data was available through the third quarter of 2008 at the time the assumptions for this report were set. The data indicated that economic activity peaked in December $2007{ }^{1}$ with the level of output (GDP) above the long-term sustainable trend level. Economic growth subsequently weakened with the level of output reaching the sustainable trend level by the middle of 2008. The actual growth rate in real GDP was slightly negative for the third quarter of 2008 and was projected to be significantly negative for the fourth quarter in all three alternatives. For the intermediate and low-cost alternatives, the current recession was projected to be followed by a recovery period with economic growth sufficient to return output to the sustainable level, but not beyond that level. For the high-cost alternative, the economy is assumed to experience a second recession before returning only to the sustainable level of output. Under all three sets of assumptions the economy is assumed to reach and maintain a sustainable, potential trend level of output by the end of the short-range period. Economic cycles are not included in the assumptions beyond the first 10 years of the projection period because complete cycles have little effect on the long-range estimates of financial status.

For this year's intermediate projections, real GDP growth is assumed to decline through the second quarter of 2009. The recovery from the recession brings economic activity to the projected stable, sustainable path by the end of 2015. For 2017 and later, real GDP is projected to be about 1.4 percent lower than in the 2008 report, based on recent data and the effects of the

[^11]recession. These revised economic assumptions account for about half of the estimated reduction in the program's actuarial balance relative to last year's report. The effect of the recession on the actuarial balance would be smaller than projected in this report if the recovery were such that economic output substantially overshoots the projected sustainable path, a phenomenon observed in some past business cycles.
The following sections 1 through 4 present the principal economic assumptions for the three alternatives that are summarized in table V.B1. The subsequent sections 5 through 7 present additional economic factors, summarized in table V.B2, that are critical to the projections of the future financial status of the combined OASI and DI Trust Funds.

## 1. Productivity Assumptions

Total U.S. economy productivity is defined as the ratio of real gross domestic product (GDP) to hours worked by all workers. ${ }^{1}$ The rate of change in totaleconomy productivity is a major determinant in the growth of average earnings. For the 40 years from 1967 to 2007, annual increases in total productivity averaged 1.7 percent, the result of average annual increases of 2.0, 1.3, 1.3 , and 2.1 percent for the 10 -year periods 1967-77, 1977-87, 1987-97, and 1997-2007, respectively. However, it should be noted that this growth rate of 1.7 percent reflects a shift of employment from low (farm) to high (nonfarm) productivity sectors that is not expected to continue in the future.

Because productivity growth can vary substantially within economic cycles, it is most useful to consider historical average growth rates for complete economic cycles. The annual increase in total productivity averaged 1.6 percent over the last five complete economic cycles (measured from peak to peak), covering the 41 -year period from 1966 to 2007. The annual increase in total productivity averaged $2.2,1.2,1.2,1.6$, and 2.0 percent over the economic cycles 1966-73, 1973-78, 1978-89, 1989-2000, and 2000-07, respectively.

The ultimate annual increases in productivity are assumed to be $2.0,1.7$, and 1.4 percent for the low-cost, intermediate, and high-cost assumptions, respectively, and are consistent with ultimate annual increases in non-farm productivity of $2.4,2.0$, and 1.7 percent. These rates of increase are the same as those used in the 2008 report, and reflect the belief that recent strong growth in non-farm business productivity, after the relatively poor perfor-

[^12]
## Assumptions \& Methods

mance from 1973 to 1995, is consistent with future long-term growth that mirrors the long-term trends of the past.

In the near term for the intermediate assumptions, the negative growth in real GDP is assumed to continue through the first half of 2009. The quarterly change in real GDP (on an annual basis) is assumed to be $-0.5,-6.0,-4.0$, and -1.5 percent for 2008 Q3 (i.e., the third calendar quarter of 2008), 2008Q4, 2009Q1, and 2009Q2, respectively. The total decline in real GDP from 2008Q2 to 2009Q2 is assumed to be 3.0 percent, giving this recession the largest consecutive quarterly decline in real output since the 1957-58 recession. The economy is assumed to begin recovering in 2010 and reach its fullemployment or sustainable trend level of output in 2015. The annual change in real GDP is assumed to be 1.1 percent for 2008, -2.2 percent for 2009, 2.4 percent for 2010, and to average about 3.6 percent over the 5 -year recovery period from 2010 to 2015. Following this pattern, the annual change in total-economy productivity is assumed to be 1.8 percent for $2008,0.3$ percent for 2009, 2.8 percent for 2010, and to average about 1.9 percent over the 5 -year recovery period from 2010 to 2015. The annual change in total-economy productivity then falls to its assumed ultimate annual rate of 1.7 percent in 2018 and later.

For the low-cost assumptions, the economy is assumed to experience a milder recession and a faster recovery. The annual change in total-economy productivity is assumed to be $1.8,0.6,2.9,2.5$, and 2.2 percent for 2008, 2009, 2010, 2011, and 2012, respectively, and to average the assumed ultimate annual rate of 2.0 percent thereafter. For the high-cost assumptions, the annual change in productivity decreases from 1.7 percent for 2008 to 0.0 percent for 2009 . Thereafter, the annual change in productivity varies with economic cycles until reaching its ultimate growth rate of 1.4 percent for 2020.

## 2. Price Inflation Assumptions

Future changes in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI) will directly affect the OASDI program through the automatic cost-of-living benefit increases. Future changes in the GDP price index (GDP deflator) affect the nominal levels of GDP, wages, self-employment income, average earnings, and taxable payroll.

Historically, the CPI increased at an average annual rate of 4.6 percent for the 40 years from 1967 to 2007, the result of average annual increases of 6.1, 6.3 , 3.4 , and 2.6 percent for the 10-year periods 1967-77, 1977-87, 1987-97, and 1997-2007, respectively. The GDP deflator increased at an average annual rate of 4.1 percent from 1967 to 2007, the result of average annual
increases of $6.0,5.5,2.7$, and 2.3 percent for the same respective 10 -year periods.

The ultimate annual increases in the CPI are assumed to be $1.8,2.8$, and 3.8 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These rates of increase are the same as those used in the 2008 report, and reflect a belief that future inflationary shocks will likely be offset by succeeding periods of relatively slow inflation due to persistent international competition, and that future monetary policy will be similar to that of the last 20 years, with its strong emphasis on holding the growth rate in prices to relatively low levels.

For each alternative in the 2008 report, the ultimate annual increase in the GDP deflator was assumed to be equal to the annual increases in the CPI minus a 0.4 percentage point price differential. The price differential is based primarily on methodological differences in the construction of the two indices. For the 2009 report, the ultimate annual increase in the GDP deflator is assumed to be equal to the annual increases in the CPI minus a $0.3,0.4$, and 0.5 percentage point price differential for the low-cost, intermediate, and high-cost alternatives, respectively. Varying the ultimate projected price differential across alternatives better recognizes the historical variation in this concept. Hence, for the 2009 report, the ultimate annual increase in the GDP deflator is assumed to be 1.5 (1.8 less 0.3), 2.4 (2.8 less 0.4 ), and 3.3 (3.8 less 0.5 ) percent for the low-cost, intermediate, and high-cost alternatives, respectively.

For the intermediate assumptions, the annual change in the CPI is assumed to decrease from 4.3 percent for 2008 to -1.0 and 1.7 percent for 2009 and 2010, respectively, due to the effects of the recession and a decline in the price of a barrel of oil in late 2008. The annual change in the CPI is assumed to gradually increase to 3.1 percent for 2013 as the economy recovers and the demand for oil increases. The annual change in the CPI is assumed to recede to its assumed ultimate annual increase of 2.8 percent for 2015 and later. Because the level of the CPI in 2009Q3 and 2010Q3 is not assumed to be above the level of the CPI in 2008Q3, the automatic cost-of-living benefit increase for 2009 and 2010 is projected to be 0.0 percent. The price differential, defined as the percent change in the CPI less the percent change in the GDP deflator, is estimated to be 2.1 percentage points for 2008 and projected to be -2.1 percentage points for 2009 . This swing in the price differential is due to the dramatic rise of oil prices for 2008 and the subsequent fall to lower average prices for 2009. The rise and fall in oil prices affected CPI much more than the GDP deflator because oil is a much larger share of what we consume than of what we produce in the U.S. As the economy recovers,

## Assumptions \& Methods

the relative price of oil rises and the price differential is assumed to average about 0.8 percentage point over the 4-year period from 2010 to 2013. After the economy returns to full employment, the relative price of oil stabilizes and the price differential is assumed to fall to its ultimate assumed value of 0.4 percentage point for 2015 and later.

For the low-cost assumptions, the annual change in the CPI is assumed to decrease from 4.3 percent for 2008 to -1.2 and 1.3 percent for 2009 and 2010, respectively. Thereafter, the annual change in the CPI is assumed to gradually increase to 2.1 percent for 2013 and then decrease to its assumed ultimate annual change of 1.8 percent for 2015 . For the high-cost assumptions, the annual change in the CPI is assumed to decrease from 4.3 percent for 2008 to -0.4 and 2.2 percent for 2009 and 2010, respectively. Thereafter, the annual change in the CPI is assumed to gradually increase to 6.0 percent for 2013 and then decrease to its assumed ultimate annual change of 3.8 percent for 2015.

## 3. Average Earnings Assumptions

The average level of nominal earnings in OASDI covered employment for each year has a direct effect on the size of the taxable payroll and on the future level of average benefits. In addition, under the automatic-adjustment provisions in the law, growth in the average wage in the U.S. economy directly affects certain parameters used in the OASDI benefit formulas and additional parameters used for the computation of the contribution and benefit base, the exempt amounts under the retirement earnings test, the amount of earnings required for a quarter of coverage, and under certain circumstances, the automatic cost-of-living benefit increases.

Average U.S. earnings is defined as the ratio of the sum of total U.S. wage and salary disbursements and proprietor income to the sum of total U.S. military and total civilian household employment. The growth rate in average U.S. earnings for any period is equal to the combined growth rates for total U.S. economy productivity, average hours worked, the ratio of earnings to compensation (which includes fringe benefits), the ratio of compensation to GDP, and the GDP deflator. Assumed future growth rates in productivity and the GDP deflator are discussed in the previous two sections.

The average annual change in average hours worked was -0.2 percent over the last 40 years, and $-0.7,-0.1,0.3$, and -0.4 percent for the 10 -year periods 1967-77, 1977-87, 1987-97, and 1997-2007, respectively. The average annual change in average hours worked was -0.3 percent over the last five complete economic cycles covering the period from 1966 to 2007. The annual change in average hours worked averaged $-0.7,-0.6,0.0,0.1$, and
-0.6 percent over the economic cycles 1966-73, 1973-78, 1978-89, 19892000, and 2000-07, respectively.

For the 2009 report, the ultimate annual rates of change for average hours worked are assumed to be $0.1,0.0$, and -0.1 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These ultimate annual rates of change for average hours worked are the same as those assumed for the 2008 report.

The average annual change in the ratio of earnings to compensation was -0.2 percent from 1967 to 2007 . For wage workers, the assumed ultimate annual rates of change in the ratio of earnings to compensation are $-0.1,-0.2$, and -0.3 percent for the low-cost, intermediate, and high-cost assumptions, respectively. Under the intermediate assumptions, the ratio of wages to employee compensation is projected to decline from 0.813 for 2008 to 0.695 for 2083. The ratio of compensation to GDP is assumed to be stable.

Thus, the ultimate projected annual growth rate in average U.S. earnings is about 3.9 percent for the intermediate assumptions. This growth rate reflects assumed ultimate annual growth rates of about $1.7,-0.2,0.0$, and 2.4 percent for productivity, the ratio of earnings to compensation, average hours worked, and the GDP deflator, respectively. Similarly, the ultimate projected annual growth rate in average nominal U.S. earnings is 3.5 percent for the low-cost assumptions and 4.3 percent for the high-cost assumptions.

Over long periods of time the average annual growth rates in average U.S. earnings and average earnings in OASDI covered employment are expected to be very close to the average annual growth rates in the average wage in OASDI covered employment (henceforth the "average covered wage"). Thus, the assumed ultimate annual growth rates in the average covered wage are 3.5 , 3.9 , and 4.3 percent for the low-cost, intermediate, and high-cost assumptions, respectively. For the intermediate assumptions, the annual rate of change in the average covered wage is assumed to decrease from 3.3 percent for 2008 to 0.7 percent for 2009, following the recession to its low point. As the economy recovers, the annual rate of change in the average covered wage is assumed to increase to 3.4 percent in 2010 and to average about 4.1 percent over the 5 -year period from 2011 to 2015 . Thereafter, the annual rate of change in the average covered wage decreases and reaches its assumed ultimate rate of change of 3.9 percent for 2018.

## 4. Assumed Real-Wage Differentials

For simplicity, real increases in the average OASDI covered wage have traditionally been expressed in the form of real-wage differentials-i.e., the per-
centage change in the average covered wage minus the percentage change in the CPI. This differential is closely related to assumed growth rates in average earnings and productivity, which are discussed in the previous sections. Over the 40 -year period, 1968-2007, the real-wage differential averaged 0.8 percentage point, the result of averages of $0.5,0.7,0.8$, and 1.4 percentage points for the 10 -year periods 1968-77, 1978-87, 1988-97, and 1998-2007, respectively. The assumed ultimate annual average covered real-wage differentials are $1.7,1.1$, and 0.5 percentage point(s) for the lowcost, intermediate, and high-cost assumptions, respectively.

Based on preliminary data, the real-wage differential is estimated to be -1.0 percentage point for 2008 . For the intermediate assumptions, the real-wage differential is projected to rise to 1.8 percentage points for 2009, 2010, and 2011. Thereafter, the real-wage differential is projected to average the assumed ultimate differential of 1.1 percentage points. For the low-cost assumptions, the real-wage differential is projected to average 2.3 percentage points for the 2009 to 2011 period, and thereafter to average the assumed ultimate differential of 1.7 percentage points. For the high-cost assumptions, the real-wage differential is projected to average 1.4 percentage points for the 2009 to 2011 period vary with a second recession and recovery over the 2012 to 2018 period, and average the assumed ultimate differential of 0.5 percentage point thereafter.

${ }^{\text {a }}$ For rows with a single year listed, the value is the annual percentage change from the prior year. For rows with a range of years listed, the value is the compound average annual percentage change.
${ }^{\mathrm{b}}$ For rows with a single year listed, the value is the unrounded annual percentage change in the average annual wage in covered employment less the unrounded annual percentage change in the Consumer Price Index. For rows with a range of years listed, the value is the average of unrounded annual values of the differential.
${ }^{c}$ Historical data are not available for the full year. Estimated values vary slightly by alternative and are shown for the intermediate alternative.

## 5. Labor Force and Unemployment Projections

The civilian labor force is projected by age, sex, marital status, and presence of children. Projections of the labor force participation rates for each subgroup take into account the percentages of the population that are disabled or in the military, the levels of Social Security retirement benefits, the state of the economy, and changes in life expectancy. The projections also include a "cohort effect" that applies differences in participation rates for a cohort at a specific age (relative to earlier cohorts at the same age) to participation rates for that cohort at older ages.

The annual rate of growth in the size of the labor force decreased from an average of about 2.1 percent during the 1970s and 1980s to about 1.1 percent from 1990 to 2008. Further slowing of labor force growth is projected due to a substantial slowing of growth in the working age population in the futurea natural consequence of the baby-boom generation approaching retirement and the succeeding lower-birth-rate cohorts reaching working age. Under the intermediate assumptions, the labor force is projected to increase by about 0.7 percent per year, on average, through 2018. Thereafter, the labor force is projected to increase much more slowly, averaging 0.5 percent over the 2018 to 2050 period, and 0.4 percent over the remainder of the 75 -year projection period.

The ultimate projected labor force participation rates are not basic assumptions. They are derived from a historically-based structural relationship using demographic and economic assumptions specific to each alternative. However, the participation rates are not highly sensitive to most of the demographic and economic assumptions. Thus, the projected labor force participation rates vary modestly into the future and across alternatives.

Historically, labor force participation rates have been influenced substantially by trends in demographics and pensions. Between the mid-1960s and the mid-1980s, labor force participation rates at ages 50 and over declined for males and were fairly stable for females. These overall declines were facilitated by the large numbers of workers entering the labor force from the baby-boom generation, and from the female population in general, during this period. This increasing supply of labor allowed employers to offer earlyretirement options that were attractive. Between the mid-1980s and about 1995, participation rates roughly stabilized for males and increased for females. Since 1995, however, participation rates for both sexes at ages 50 and over have generally risen significantly, reflecting a decrease in early-out options and relatively strong economic growth.

For the future, changes in available benefit levels from Social Security, increases in the normal retirement age, and the effects of modifying the earn-
ings test are expected to encourage work at older ages. Some of these factors are modeled directly. However, other factors, like the trend away from private defined-benefit pension plans (that often provided incentives to retire) toward defined-contribution plans, are expected to provide additional upward pressure on labor force participation rates. In addition to this shift in private pensions, the aging of the population is expected to both increase the demand for workers and, through improved health associated with greater life expectancy, improve the ability of the older population to work. Longer life expectancy will also increase the amount of assets that will be needed to live comfortably through retirement years, thus encouraging workers to stay employed longer. In order to account for these effects, which are directly or indirectly related to increases in life expectancy, projected participation rates for prime age and older males and females are adjusted upward in relation to assumed increases in life expectancy. For the intermediate projections, this adjustment for changes related to life expectancy adds about 1.4 percent to the total labor force by 2083.

For men age 16 and over, the projected age-adjusted labor force participation rates for 2083 are $72.6,73.0$, and 73.6 percent for the low-cost, intermediate, and high-cost assumptions, respectively, compared to the 2007 level of 73.2 percent. (Age-adjusted labor force participation rates are adjusted to the 2007 age distribution of the civilian noninstitutional U.S. population.) These rates reflect the net effect of increases due to assumed improvements in life expectancy, and decreases due to higher assumed disability prevalence rates and an increasing proportion of males who are never married. For women age 16 and over, the projected age-adjusted labor force participation rates for 2083 are $60.3,60.4$, and 60.3 percent, for the low-cost, intermediate, and high-cost assumptions, respectively, compared to the 2007 level of 59.3 percent. These projections reflect the combination of decreases due to higher assumed disability prevalence rates, increases due to assumed improvements in life expectancy, and increases due to assumed changes in the proportion of females who are separated, widowed, divorced, or never married.

The unemployment rate presented in table V.B2 is in the most commonly cited form, the civilian rate. For years through 2018, total rates are presented without adjustment for the changing age-sex distribution of the population. For years after 2018, unemployment rates are presented as total age-sexadjusted rates (using the age-sex distribution of the 2007 civilian labor force). Age-sex-adjusted rates allow for more meaningful comparisons across longer time periods.

## Assumptions \& Methods

The total unemployment rate reflects the projected levels of unemployment for various age-sex subgroups of the population. The unemployment rate for each subgroup is projected based on a specification (consistent with Okun's Law) relating changes in the unemployment rate to the changes in the economic cycle, as measured by the ratio of the actual to potential GDP. For each alternative, the total unemployment rate is projected to move toward the ultimate assumed rate as the economy moves toward the long-range sustainable growth path.

The ultimate age-sex-adjusted unemployment rate for each alternative is assumed to be reached by 2018. The ultimate assumed unemployment rates are $4.5,5.5$, and 6.5 percent for the low-cost, intermediate, and high-cost assumptions, respectively. These are the same values assumed for the 2008 report.

## 6. Gross Domestic Product Projections

The real growth rate in gross domestic product (GDP) equals the combined growth rates for total employment, productivity, and average hours worked. Total employment is the sum of the U.S. Armed Forces and total civilian employment, which is based on the projected total civilian labor force and unemployment rates. For the 40-year period from 1967 to 2007, the average growth rate in real GDP was 3.0 percent, combining the approximate growth rates of 1.6, 1.7, and -0.2 percent for its components-total employment, productivity, and average hours worked, respectively.

For the intermediate assumptions, the average annual growth in real GDP is projected to be 2.4 percent from 2008 to 2018, a slower rate than the 3.0 percent average observed over the historical 40-year period from 1967 to 2007. This slowdown is primarily due to slower projected growth in total employment. For the low-cost assumptions, annual growth in real GDP is projected to average 3.1 percent over the decade ending in 2018. The relatively faster growth is due mostly to higher assumed rates of growth for employment and worker productivity. For the high-cost assumptions, real GDP is assumed to fall in the third and fourth quarters of 2008 and in the first three quarters of 2009, resulting in a total decline in real GDP for these five quarters of 4.0 percent. After 10 quarters of recovery, a second recession, with a total decline in real GDP of 2.1 percent, is assumed to begin in the second quarter of 2012 and last two quarters. After the second recession, a moderate economic recovery is assumed through 2015, with continued modest economic growth thereafter. For the high-cost assumptions, annual growth in real GDP is projected to average 1.8 percent for the decade ending in 2018.

After 2018, no economic cycles are assumed for the three alternatives. Accordingly, projected rates of growth in real GDP are determined by the projected full-employment rate of growth for total employment, and the assumed full-employment rates of growth for total U.S. economy productivity and average hours worked. For the intermediate assumptions, the projected rate of growth for real GDP falls toward the assumed productivity growth rate because of the projected decline in labor force growth over the period. At the end of the 75-year projection period, the annual growth in real GDP is 2.1 percent, due to the assumed ultimate percent changes of about $0.4,1.7$, and 0.0 for total employment, productivity, and average hours worked, respectively.

## 7. Interest Rates

The average annual nominal and real interest rates are presented in table V.B2. The nominal rate is the average of the nominal interest rates for special U.S. Government obligations issuable to the trust funds in each of the 12 months of the year. Interest for these securities is generally compounded semiannually. The real interest rate (ex post) is defined to be the annual compound yield rate for investments in these securities divided by the annual rate of growth in the CPI for the first year after issuance. The real rate shown for each year reflects the actual realized (historical) or expected (future) annual real yield on securities issuable in the prior year.

In developing a reasonable range of assumed ultimate future real interest rates for the three alternatives, historical experience was examined for the 40 years, 1968-2007, and for each of the 10-year subperiods, 1968-77, 1978-87, 1988-97, and 1998-2007. For the 40-year period, the real interest rate averaged 2.8 percent per year. For the four 10-year subperiods, the real interest rates averaged $0.4,4.1,4.2$, and 2.6 percent, respectively. The assumed ultimate real interest rates are 3.6 percent, 2.9 percent, and 2.1 percent for the low-cost, intermediate, and high-cost assumptions, respectively, and are unchanged from the 2008 report. These ultimate real interest rates, when combined with the ultimate CPI assumptions of $1.8,2.8$, and 3.8 percent, yield ultimate nominal interest rates of about 5.4 percent for the low-cost assumptions, about 5.7 percent for the intermediate assumptions, and about 5.9 percent for the high-cost assumptions. These ultimate nominal rates are assumed to be reached by the end of the short-range period.

The actual average annual nominal interest rate is 4.7 percent for 2007. The annual rate of change in the CPI is assumed to be 4.3 percent for 2008. Hence, the annual real interest rate is 0.4 percent for 2008 . For the next 10year short-range projection period, nominal interest rates are projected based

## Assumptions \& Methods

on changes in the business cycle and in the CPI. Under the intermediate assumptions, the nominal interest rate is projected to decline from an actual value of 3.6 percent for 2008 to 3.0 percent for 2009 , reflecting a weak economy along with a negative rate of inflation. Thereafter, the nominal interest rate rises to the ultimate assumed level of 5.7 percent for 2018 . For the lowcost assumptions, the average annual nominal interest rate is assumed to reach an ultimate level of about 5.4 percent for 2017. For the high-cost assumptions, it is assumed to peak at 8.6 percent for 2014 , and then decline to an ultimate rate of about 5.9 percent by 2018 .

${ }^{\text {a }}$ The unemployment rates for 2019 and later are adjusted to the age-sex distribution of the civilian labor force in 2007. All other rates are unadjusted.
${ }^{\mathrm{b}}$ For rows with a single year listed, the value is the annual percentage change from the prior year. For rows with a range of years listed, the value is the compounded average annual percentage change.
${ }^{\mathrm{c}}$ The U.S. civilian labor force concept is used here.
${ }^{\mathrm{d}}$ Total of civilian and military employment in the U.S. economy.
${ }^{\mathrm{e}}$ The real GDP (gross domestic product) is the value of total output of goods and services in 2000 dollars.
${ }^{\mathrm{f}}$ The average annual nominal interest rate is the average of the nominal interest rates, which, in practice, are compounded semiannually, for special public-debt obligations issuable to the trust funds in each of the 12 months of the year.
g The average annual real interest rate reflects the realized or expected annual real yield for each year on securities issuable in the prior year.
${ }^{\mathrm{h}}$ Historical data are not available for the full year. Estimated values vary slightly by alternative and are shown for the intermediate assumptions.

## C. PROGRAM-SPECIFIC ASSUMPTIONS AND METHODS

The demographic and economic assumptions and methods described in the previous sections are used in a set of models to project future income and cost under the OASDI program. In some cases, the economic assumptions result in the direct calculation of program parameters as described in the following subsection. These parameters affect the level of payroll taxes collected and the level of benefits paid and are calculated using formulas described explicitly in the Social Security Act. In other cases, the combination of demographic and economic assumptions are used indirectly to drive more complicated models that project the numbers of future workers covered under OASDI and the levels of their covered earnings, and the numbers of future beneficiaries and the expected levels of their benefits. The following subsections provide brief descriptions of the derivations of these programspecific factors.

## 1. Automatically Adjusted Program Parameters

The Social Security Act specifies that certain program parameters affecting the determination of OASDI benefits and taxes are to be adjusted annually in a manner that reflects changes in particular economic measures. The law prescribes specific formulas that, when applied to reported statistics, produce automatic revisions in these program parameters and hence in the benefit and tax computations. These automatic adjustments are based on measured changes in the national average wage index (AWI) and the CPI. ${ }^{1}$ In this section, values are shown for program parameters that are subject to automatic adjustment, from the time that such adjustments became effective through 2018. Projected values for future years are based on the economic assumptions described in the preceding section of this report.

The following two tables present the historical and projected values of the CPI-based benefit increases, as well as the AWI series and the values of many of the wage-indexed program parameters. In each table, the projections are shown under the three alternative sets of economic assumptions described in the previous section. Table V.C1 includes:

- The annual percentage increases that have been applied to OASDI benefits under automatic cost-of-living adjustment provisions in the Social Security Act, based on increases in the CPI. Under all three sets of eco-

[^13]nomic assumptions, no cost-of-living adjustment becomes effective for December of 2009 (and in some later years under the intermediate and low-cost assumptions).

- The annual levels of and percentage increases in the AWI. Under section 215(b)(3) of the Social Security Act, the AWI for each year after 1950 is used to index the taxable earnings of most workers first becoming eligible for benefits in 1979 or later. This procedure converts a worker's past earnings to approximately benefit equivalent values near the time of the worker's benefit eligibility, and these indexed values are used to calculate the worker's benefit amount. The AWI is also used to adjust most of the other program parameters that are subject to the auto-matic-adjustment provisions.
- The wage-indexed contribution and benefit base-the maximum amount of earnings for the specified year that are subject to the OASDI payroll tax and creditable toward benefit computation. The Social Security Act prohibits an increase in this base if there is no cost-of-living adjustment effective for December of the preceding year.
- The wage-indexed retirement earnings test exempt amounts-the annual amount of earnings below which beneficiaries are not subject to benefit withholding. A lower exempt amount applies in years before a beneficiary attains normal retirement age (NRA). A higher amount applies for the year in which the beneficiary attains normal retirement age. The retirement test does not apply beginning with the attainment of normal retirement age. The Social Security Act prohibits an increase in these exempt amounts if there is no cost-of-living adjustment effective for December of the preceding year.

${ }^{\text {a }}$ Effective with benefits payable for June in each year 1975-82, and for December in each year after 1982.
${ }^{\mathrm{b}}$ See table VI.F6 for projected dollar amounts of the AWI beyond 2018.
c Amounts for 1979-81 were specified by Public Law 95-216. The bases for years after 1989 were increased slightly by changes to the indexing procedure, as required by Public Law 101-239.
${ }^{\mathrm{d}}$ Normal retirement age. See table V.C3 for specific values.
${ }^{e}$ In 1955-82, the retirement earnings test did not apply at ages 72 and over; in 1983-99, the test did not apply at ages 70 and over; beginning in 2000, it does not apply beginning with the month of attainment of NRA. In the year of attainment of NRA, the higher exempt amount applies to earnings in the year prior to the month of NRA attainment. Amounts for 1978-82 specified by Public Law 95-216; for 1996-2002, Public Law 104-121.
${ }^{\mathrm{f}}$ Originally determined as 2.4 percent, but pursuant to Public Law 106-554, is effectively 2.5 percent.
g Actual amount, as determined under automatic-adjustment provisions.
Values for other wage-indexed parameters are shown in table V.C2. The table provides historical values from 1978, when the amount of earnings required for a quarter of coverage was first indexed, through 2009, and also shows projected amounts through 2018. These other wage-indexed program parameters are:

- The bend points in the formula for computing the primary insurance amount (PIA) for workers who reach age 62, become disabled, or die in a given year. As illustrated in figure V.C1, these bend points indicate three ranges in a worker's average indexed monthly earnings (AIME) over which a certain percent factor, 90,32 , or 15 percent, respectively, is applied to determine the worker's PIA.

Figure V.C1.—Primary-Insurance-Amount Formula for Those Newly Eligible in 2009

- Bend points in the formula used to compute the maximum total amount of monthly benefits payable on the basis of the earnings of a retired or deceased worker. This formula is a function of the worker's PIA, and, as shown in figure V.C2, relies on four intervals and percentages.

Figure V.C2.-Maximum-Family-Benefit Formula for Those Newly Eligible in 2009

- The amount of earnings required in a year to be credited with a quarter of coverage (QC). The number and timing of QCs earned is used to determine an individual's insured status-the basic requirement for benefit eligibility under OASDI.
- The old-law contribution and benefit base-the contribution and benefit base that would have been in effect in each year after 1977 under the automatic-adjustment provisions as in effect before the enactment of the 1977 amendments. This old-law base is used in determining specialminimum benefits for certain workers who have many years of low earnings in covered employment. Beginning in 1986, the old-law base is also used in the calculation of OASDI benefits for certain workers who are eligible to receive pensions based on noncovered employment. In addition, it is used for certain purposes under the Railroad Retirement program and the Employee Retirement Income Security Act of 1974.

Table V.C2.-Values for Selected Wage-Indexed Program Parameters,

${ }^{\text {a }}$ The formula to compute a PIA is (1) $90 \%$ of AIME below the first bend point, plus (2) $32 \%$ of AIME in excess of the first bend point but not in excess of the second, plus (3) $15 \%$ of AIME in excess of the second bend point. The bend points pertain to the first year a beneficiary becomes eligible for benefits.
${ }^{\mathrm{b}}$ The formula to compute a family maximum is (1) $150 \%$ of PIA below the first bend point, plus (2) $272 \%$ of PIA in excess of the first bend point but not in excess of the second, plus (3) $134 \%$ of PIA in excess of the second bend point but not in excess of the third, plus (4) $175 \%$ of PIA in excess of the third bend point.
${ }^{\text {c C Contribution and benefit base that would have been determined automatically under the law in effect prior }}$ to enactment of the Social Security Amendments of 1977. The bases for years after 1989 were increased slightly by changes to the indexing procedure to determine the base, as required by Public Law 101-239.
${ }^{\mathrm{d}}$ No provision in law for this amount in this year.
${ }^{\text {e }}$ Amount specified for first year by Social Security Amendments of 1977; amounts for subsequent years subject to automatic-adjustment provisions.

In addition to the program parameters affecting the determination of OASDI benefits that reflect changes in the economy, there are certain legislated changes that have affected, and will affect, benefits. Two such changes are the scheduled increases in the normal retirement age and in the delayed retirement credits. Table V.C3 shows the scheduled changes in these parameters and the resulting effects on benefit levels expressed as a percentage of PIA.

Table V.C3.-Legislated Changes in Normal Retirement Age and Delayed Retirement
Credits, for Persons Reaching Age 62 in Each Year 1986 and Later

## 2. Covered Employment

Projections of the total labor force and unemployment rate are based on Bureau of Labor Statistics definitions from the Current Population Survey (CPS), and thus represent the average weekly number of employed and unemployed persons, aged 16 and over, in the U.S. in a calendar year. Total covered workers in a year are the number of persons who have any OASDI covered earnings (earnings subject to the OASDI payroll tax) at any time during the year. For those aged 16 and over, projected covered employment is the sum of age-sex components, each of which is projected as a ratio to the CPS concept of employment. For those under age 16, projected covered employment is the sum of age-sex components, each of which is projected as a ratio to the Social Security area population. The projection methodology accounts for changes in the business cycle, the quarterly pattern of growth in employment within each year, changes in non-OASDI covered employment, the increase in coverage of Federal civilian employment as a result of the 1983 Social Security Amendments, and changes in the number and employ-
ment-status of other immigrants estimated to be residing within the Social Security coverage area.

Covered-worker rates are defined as the ratio of OASDI covered workers to the Social Security area population. The age-adjusted coverage rate for males age 16 and over is projected to be 70.7, 70.1, and 69.7 percent for 2083 for the low-cost, intermediate, and high-cost assumptions, respectively, compared to the 2007 level of about 71.7 percent. (Age-adjusted covered worker rates are adjusted to the 2007 age distribution of the Social Security area population.) For females, the projected age-adjusted coverage rate changes from its 2007 level of 63.3 percent to 63.8, 63.1, and 62.4 percent for 2083 for the low-cost, intermediate, and high-cost assumptions, respectively.

## 3. Taxable Payroll and Payroll Tax Revenue

The OASDI taxable payroll is the amount of earnings in a year that, when multiplied by the combined employee-employer tax rate, yields the total amount of taxes due from wages and self-employed income in the year. Taxable payroll is used in estimating OASDI income and in determining income and cost rates and actuarial balances. (See section IV.B.1, Annual Income Rates, Cost Rates, and Balances, for definitions of these terms.) Taxable payroll is computed from taxable earnings, defined as the sum of wages and selfemployment earnings subject to the Social Security tax. In computing taxable payroll, wages are adjusted to take into account the "excess wages" earned by workers with multiple jobs whose combined wages exceed the contribution and benefit base. Also, from 1983 through 2001, taxable payroll includes deemed wage credits for military service. Prior to 1984, the selfemployed tax rate was less than the combined employee-employer rate, thus taxable self-employed earnings were weighted to reflect this. Also, prior to 1988, employers were exempt from paying Social Security tax on part of their employees’ tips; taxable payroll was thus reduced by half of the amount of tips to take this into account.

The computation of taxable earnings for employees, employers, and the selfemployed is based on total earnings in covered employment. Covered earnings are summed from component sectors of the economy, including private, State and local, Federal civilian, and military. Covered earnings for each sector are based on the projected growth of U.S. earnings and a factor that reflects any projected change in coverage (e.g., the increase in coverage in the Federal civilian sector due to mandatory coverage of newly hired employees). The level of taxable earnings reflects only the portion of covered earnings that is at or below the contribution and benefit base. The portion of covered earnings that is taxable (i.e., at or below the base) was about

## Assumptions \& Methods

89.5, 86.9, and 82.8 percent for 1983, 1994, and 2000, respectively. This ratio of taxable earnings to covered earnings rose to about 85.8 for 2002, then fell to 82.7 for 2007. The average annual rate of change in the ratio was about -0.3 percent between 1983 and 2007. Most of this decline was due to a relative increase in wages for high earners.

The ratio is assumed to increase to about 85.2 percent for 2009 for the intermediate assumptions due, in part, to a recession-induced reduction in the relative amount of wages of high earners. The projected taxable earnings ratios in 2018 are $83.7,82.9$, and 82.1 percent for the low-cost, intermediate, and high-cost assumptions, respectively. After 2018, the taxable-to-covered earnings ratio is approximately constant.

Payroll tax revenue is computed by applying the scheduled tax rates to taxable wages and self-employment income, taking into account the lag between the time the tax liability is incurred and taxes are collected. In the case of wages, employers are required to deposit withholding taxes with the Treasury on a schedule determined by the amount of tax liability incurred. (Generally, the higher the amount of liability, the sooner the taxes must be paid-ranging from the middle of the following month for employers with few employees to the next banking day after wages are paid for companies with very large payrolls.) Self-employed workers are required to make estimated tax payments on their earnings four times during the year, as well as making up any under-estimate on their individual income tax return. The pattern of actual receipts by the Treasury is taken into account when estimating self-employed tax collections.

## 4. Insured Population

Eligibility for benefits under the OASDI program requires some minimal level of work in covered employment. This requirement is established by a worker's accumulation of quarters of coverage (QCs). Prior to 1978, one QC was credited for each calendar quarter in which at least $\$ 50$ was earned. In 1978, when quarterly reporting of earnings was replaced by annual reporting, the amount required to earn a QC (up to a maximum of four per year) was set at $\$ 250$. Since then, this amount has been adjusted each year according to changes in the AWI. Its value in 2009 is $\$ 1,090$.

There are three types of insured status that can be acquired by a worker under the OASDI program. Each of these statuses is determined by the number and recency of QCs earned. Fully insured status is acquired by any worker whose total number of QCs is greater than or equal to the number of years elapsed after the year of attainment of age 21 (but not less than six).

Once a worker has accumulated 40 QCs, he or she remains permanently fully insured. Disability insured status is acquired by any fully insured worker over age 30 who has accumulated 20 QCs during the 40 -quarter period ending with the current quarter; any fully insured worker aged 24-30 who has accumulated QCs during one-half of the quarters elapsed after the quarter of attainment of age 21 and up to and including the current quarter; and any fully insured worker under age 24 who has accumulated six QCs during the 12-quarter period ending with the current quarter. Currently insured status is acquired by any worker who has accumulated six QCs during the 13-quarter period ending with the current quarter. Periods of disability are excluded from the above described QC requirements for insured status (but do not reduce the minimum of six QCs).

There are many types of benefits payable to workers and their family members under the OASDI program. A worker must be fully insured to be eligible for a primary retirement benefit, and for his or her spouse or children to be eligible for auxiliary benefits. A deceased worker must have been either currently insured or fully insured at the time of death for his or her children (and their mother or father) to be eligible for benefits. If there are no eligible surviving children, the deceased worker must have been fully insured at the time of death for his or her surviving spouse to be eligible. A worker must be disability insured to be eligible for a primary disability benefit, and for his or her spouse or children to be eligible for auxiliary benefits.

Historical estimates of the fully insured population, as a percentage of the Social Security area population, are made by age and sex for each birth cohort beginning with 1900. These percentages are based on 30,000 simulated work histories for each sex and birth cohort, which are constructed from past coverage rates, median earnings, and amounts required for crediting QCs. These work histories are developed by a model that assumes that persons who have recently been out of covered employment are likely to remain out of covered employment. This model is aligned such that the simulated fully insured percentages reproduce fairly closely the fully insured percentages estimated from the Continuous Work History Sample from 1970 to date. The fully insured population for future years is projected using this model, reflecting estimated future coverage rates, median earnings, and amounts required for crediting QCs.

Historical estimates of the disability insured population, as a percentage of the fully insured population, are made by age and sex for each birth cohort beginning with 1900. These percentages are based on the same simulated work histories used to project the fully insured percentages. Additional adjustments are made to bring the simulated disability insured percentages
into close agreement with those estimated from the Continuous Work History Sample. The principal adjustment is for periods of disability (which are not explicitly taken into account in the model). These periods (which reduce the normally applicable QC requirements) have a negligible effect on fully insured status at retirement age, but a substantial effect on disability insured status. The disability insured population for future years is projected using this model, reflecting projections of the fully insured population.

For the 2009 Trustees Report, projections of the disability insured population reflect improvements in estimating the historical disability insured population. For historical years, disability insured status is estimated using administrative records of all workers with earnings reported to the Social Security Administration. The improvements in this process generally resulted in lowering the estimated number of people in the post-1980 Social Security area population with disability insured status.

Projections of the currently insured population are not made. This is because the number of beneficiaries who are entitled to benefits based solely on currently insured status has been very small, and is expected to remain small in the future.

Under this procedure, the percentage of the Social Security area population aged 62 and over that is fully insured is projected to increase from its estimated level of 81.3 for December 31, 2006, to $90.0,90.2$, and 90.7 for December 31, 2085, under alternatives I, II, and III, respectively. The percentage for females is projected to increase significantly, while that for males is projected to decline somewhat. Under alternative II, for example, the percentage for males is projected to decrease slightly during this period from 92.7 to 90.8 , while that for females is projected to increase from 72.5 to 89.6 .

## 5. Old-Age and Survivors Insurance Beneficiaries

The number of OASI beneficiaries is projected for each type of benefit separately, by the sex of the worker on whose earnings the benefits are based, and by the age of the beneficiary. For selected types of benefits, the number of beneficiaries is also projected by marital status.

For the short-range period, the number of retired-worker beneficiaries is developed by applying award rates to the aged fully insured population less those insured persons entitled to retired-worker, disabled-worker, agedwidow(er)'s, or aged-spouse's benefits, and by applying termination rates to the number of persons already receiving retired-worker benefits.

For the long-range period, the number of retired-worker beneficiaries not previously converted from disabled-worker beneficiary status is projected as a percentage of the exposed population, i.e., the aged fully insured population less persons entitled to or converted from disabled-worker benefits and fully insured persons entitled only to widow(er)'s benefits. For age 62, a linear regression is developed based on the historical relationship between this percentage and the labor force participation rate. The regression coefficients are then used to project this percentage based on the projected labor force participation rate for age 62. The percentage for ages 70 and over is assumed to be nearly 100, because delayed retirement credits cannot be earned after age 70 . The percentage for each age 63 through 69 is projected based on historical experience with an adjustment for changes in the portion of the primary insurance amount that is payable at each age of entitlement. As the normal retirement age increases, the number of retired-worker beneficiaries not automatically converted from disabled-worker beneficiary status as a percentage of the exposed population, is gradually adjusted downward.

For the long-range period also, the number of retired-worker beneficiaries previously converted from disabled-worker beneficiaries is calculated separately in a manner consistent with the calculation of disabled-worker beneficiaries.

The number of aged-spouse beneficiaries (excluding those who are also receiving a retired-worker benefit) is estimated from the population projected by age and sex. The benefits of aged-spouse beneficiaries are based on the earnings records of their husbands or wives, who are referred to as "earners." In the short-range period, insured aged-spouse beneficiaries are projected in conjunction with the retired-worker beneficiaries. Uninsured aged-spouse beneficiaries are projected by applying award rates to the aged uninsured male or female population, and by applying termination rates to the population already receiving such benefits.

In the long-range period, aged-spouse beneficiaries are estimated separately for those married and divorced. The number of married aged-spouse beneficiaries is projected by applying a series of factors to the number of spouses aged 62 and over in the population. These factors represent the probabilities that the spouse and the earner meet all of the conditions of eligibility-i.e., the probabilities that: (1) the earner is 62 or over; (2) the earner is insured; (3) the earner is receiving benefits; (4) the spouse is not receiving a benefit for the care of an entitled child; (5) the spouse is not insured; and (6) the spouse is not eligible to receive a significant government pension based on earnings in noncovered employment. To the resulting number of spouses a

## Assumptions \& Methods

projected prevalence rate is applied to calculate the estimated number of aged-spouse beneficiaries.

The number of divorced aged-spouse beneficiaries is estimated by applying the same factors to the number of divorced persons aged 62 and over in the population, with three differences. First, an additional factor is required to reflect the probability that the person's former earner spouse is still alive (otherwise, the person may be entitled to a divorced widow(er)'s benefit). Second, a factor is required to reflect the probability that the marriage to the earner spouse was at least 10 years in duration. Third, factor (3) above is not applied because, effective as of January 1985, a divorced person generally need not wait to receive benefits until the former earner spouse is receiving benefits.

The projected numbers of children under age 18, and students aged 18 and 19, who are eligible for benefits as children of retired-worker beneficiaries, are based on the projected number of children in the population. In the shortrange period, the number of entitled children is developed by applying award rates to the number of children in the population where both parents are alive, and by applying termination rates to the number of children already receiving benefits.

In the long-range period, the number of entitled children is projected separately by sex of the earner parent. The number of entitled children is projected for each age under 18 from the latest beneficiary data by reflecting changes in the following: the number of children in the population and the ratio of retired workers aged 62 to 71 to the population aged 20 to 71 . For student beneficiaries, factors are applied to the number of children aged 18 and 19 in the population, representing the probabilities that the parent is alive, aged 62 or over, insured, and receiving a retired-worker benefit. Another factor is applied representing the probability that the child is attending a secondary school.

The number of disabled children, aged 18 and over, of retired-worker beneficiaries is projected from the adult population. In the short-range period, award rates are applied to the population, and termination rates are applied to the number of disabled children already receiving benefits. In the long-range period, disabled children are projected in a manner similar to that for student children with the inclusion of a factor reflecting the probability of being disabled before age 22 .

In the short-range period, the number of young-spouses, entitled because they have a child in their care, is developed by applying award rates to the number of awards to children of retired workers, where the children are
either under age 16 or disabled, and by applying termination rates to the number of young spouses with a child in care who are already receiving benefits. In the long-range period, young-spouse beneficiaries with a child in their care who are projected as a proportion of the projected number of child beneficiaries of retired workers, taking into account projected changes in average family size.

The number of aged-widow(er) beneficiaries (excluding those who are also receiving a retired-worker benefit) is projected from the population by age and sex. In the short-range period, fully insured aged-widow(er) beneficiaries are projected in conjunction with the retired-worker beneficiaries. Uninsured aged-widow(er) beneficiaries are projected by applying award rates to the aged uninsured male or female population, and by applying termination rates to the population already receiving such benefits. In the long-range period, aged-widow(er) beneficiaries are projected by marital status. Four factors are applied to the number of widow(er)s in the population aged 60 and over. These factors represent the probabilities that: (1) the deceased earner is fully insured at death; (2) the widow(er) is not receiving a benefit for the care of an entitled child; (3) the widow(er) is not fully insured; and (4) the widow(er)'s benefits are not withheld because of receipt of a significant government pension based on earnings in noncovered employment. In addition, some insured widow(er)s who had not applied for their retiredworker benefits are assumed to receive widow(er)'s benefits. Also, the same factors are applied to the number of divorced persons aged 60 and over in the population, with additional factors representing the probability that the person's former earner spouse is deceased and that the marriage was at least 10 years in duration.

In the short-range period, the number of disabled-widow(er) beneficiaries is developed by applying award rates to the uninsured male or female population, and by applying termination rates to the population already receiving a disabled-widow(er) benefit. In the long-range period, the number is projected for each age 50 up to NRA as percentages of the widowed and divorced populations, adjusted for the insured status of the deceased spouse, the prevalence of disability, and the probability that the disabled spouse is not receiving another type of benefit.

The projected numbers of children under age 18, and students aged 18 and 19, who are entitled for benefits as survivors of deceased workers, are based on the projected number of children in the population whose mothers or fathers are deceased. In the short-range period, the number of entitled children is developed by applying award rates to the number of orphaned chil-
dren, and by applying termination rates to the number of children already receiving benefits.

In the long-range period, the number of child-survivor beneficiaries is projected in a manner analogous to that for student beneficiaries of retired workers, with the factor representing the probability that the parent is aged 62 or over replaced by a factor that represents the probability that the parent is deceased.

In the short-range period, the numbers of entitled mother-survivor and fathersurvivor beneficiaries are developed by applying award rates to the number of awards to child-survivor beneficiaries, where the children are either under age 16 or disabled, and by applying termination rates to the number of mother-survivors and father-survivors already receiving benefits. In the longrange period, mother-survivor and father-survivor beneficiaries, assuming they are not remarried, are estimated from the number of child-survivor beneficiaries, taking into account projected changes in average family size.

The number of parent-survivor beneficiaries is projected based on the historical pattern of the number of such beneficiaries.

Table V.C4 shows the projected number of beneficiaries under the OASI program by type of benefit. Included among the beneficiaries who receive retired-worker benefits are persons who also receive a residual benefit consisting of the excess of an auxiliary benefit over their retired-worker benefit. Estimates of the number and amount of such residual payments are made separately for spouses and widow(er)s.

Table V.C4.-OASI Beneficiaries With Benefits in Current-Payment Status at the End of Calendar Years 1945-2085

${ }^{\text {a }}$ Included among the beneficiaries who receive retired-worker benefits are persons who also receive a residual benefit consisting of the excess of an auxiliary benefit over their retired-worker benefit.
Notes:

1. The number of beneficiaries does not include uninsured individuals who receive benefits under Section 228 of the Social Security Act. Costs are reimbursed from the General Fund of the Treasury for most of these individuals.
2. Totals do not necessarily equal the sums of rounded components.

## 6. Disability Insurance Beneficiaries

Benefits are paid from the DI Trust Fund to disabled workers who satisfy the disability insured requirements, who are unable to engage in substantial gainful activity due to medically determinable physical or mental impairment severe enough to satisfy the requirements of the program, and who have not yet attained normal retirement age. Spouses and children of such disabled
workers may also receive DI benefits provided they satisfy certain criteria, primarily age requirements.

The number of disabled workers receiving benefits in a given year (i.e., in current-payment status) is projected using standard actuarial methods that reflect future new benefit awards, terminations due to death and recovery, and conversions from disabled-worker to retired-worker beneficiary status after which benefits are paid from the OASI Trust Fund.

The prevalence of disability results from the likelihood of becoming disabled (incidence) as well as the likelihood that disability ceases (termination). Disability prevalence is captured by the ratio of the number of disabled-worker beneficiaries in current-payment status to the disability insured population. This ratio is referred to as the disability prevalence rate. The balance of this section describes the methods and assumptions used for projecting the number of disabled-worker beneficiaries. Incidence rates and termination rates are the key factors in these projections. This section illustrates these rates as well as the projected beneficiary population and prevalence rates.

## a. Disability Incidence

The number of new benefit awards each year divided by the number of individuals who meet insured requirements but are not yet receiving benefits (the disability exposed population) is referred to as the disability incidence rate. New awards are projected for each year by applying assumed age-sex-specific disability incidence rates to the projected disability exposed population by age and sex. Projections of the disability insured population are described in section V.C. 4 of this report.

For the first 10 years of the projection period (through 2018) incidence rates reflect several factors including: (1) aspects of program administration (such as efforts to reduce the disability backlog and recent changes to how claims are adjudicated); (2) assumed future unemployment rates; and (3) underlying trends in incidence. Notably for this year's report, all three sets of underlying economic assumptions include a continuation of the current economic recession, although of varying durations and severity. During the recession, the projected disability incidence rates are estimated to experience sharp temporary increases above the general trend level. The elevated incidence rates are assumed to subside as the economy recovers, and to briefly drop below the general trend level on the assumption that some of the earlier additional awards will be cases that would have applied in a later year. After 2018, age-sex-specific incidence rates are assumed to trend toward the ultimate rates assumed for the long-range projections and to reach these ultimate rates in 2028. These ultimate age-sex-specific disability incidence rates were

## Assumptions \& Methods

selected based on careful analysis of historical levels and patterns and expected future conditions, including the impact of scheduled increases in the normal retirement age. ${ }^{1}$ The ultimate incidence rates are assumed to represent the likely average rates of incidence for the future.

For the intermediate alternative, the ultimate age-sex-adjusted incidence rate (adjusted to the disability exposed population for the year 2000) for ages through 64 is assumed to be 5.3 awards per thousand exposed population. This level is about 2 percent higher than the average rate for the historical period 1970 through 2008. The ultimate age-sex-adjusted incidence rates for the low-cost and high-cost alternatives are assumed to be 4.2 and 6.3 awards per thousand exposed, or about 19 percent lower and 21 percent higher than the average for the historical period, respectively. For the 2009 report, the ultimate assumed age-sex-adjusted incidence rates are essentially the same as in last year's report.

Historical incidence rates and assumed incidence rates under the three alternatives are illustrated in figure V.C3. Incidence rates have varied within a wide range over the past 35 years. This variation is attributed to a variety of demographic and economic factors, along with the effects of changes due to legislation and program administration. ${ }^{2}$ The solid lines in figure V.C3 illustrate values of the incidence rate, age-sex adjusted to the distribution of the disability exposed population for 2000 . Such adjustment facilitates meaningful comparisons over long periods of time by focusing on the likelihood of becoming disabled, and excluding the effects of a changing distribution of the population toward ages where disability is inherently more or less likely.

Gross (unadjusted) incidence rates are also shown in figure V.C3 in dashed lines. Unadjusted rates are influenced by the changing age-sex distribution of the exposed population over time. The gross incidence rate fell substantially below the age-sex-adjusted rate between 1975 and 1995 as the baby-boom generation swelled the size of the younger working-age population, where disability incidence is low. After 1995, the gross rate rose relative to the age-sex-adjusted rate, reflecting the aging of the baby-boom generation into higher ages, where disability incidence increases substantially. After 2023, the gross incidence rate declines relative to the age-sex-adjusted rate as the baby-boom generation moves above the normal retirement age (NRA), and is

[^14]replaced at prime disability ages ( 50 to NRA) by the smaller cohorts born in the 1970s. As these smaller cohorts age past NRA, by about 2050, the gross incidence rate returns to a higher relative level under the intermediate assumptions. Thereafter, the gross rate remains higher, reflecting the persistently higher average age of the working-age population, which is largely due to lower birth rates since 1965.

Figure V.C3.-DI Disability Incidence Rates, 1970-2085 [Awards per thousand disability exposed]

## b. Disability Termination

Disability benefits may be terminated if a beneficiary dies or recovers from the disabling condition (as indicated by either medical improvement or return to work). The termination rate is the ratio of the number of terminations to the average number of disabled-worker beneficiaries during the year.

Termination rates are projected by age, sex, and reason for termination. In addition, in the long-range period (post-2018) termination rates are also assumed to vary by duration of entitlement to disabled-worker benefits.

## Assumptions \& Methods

In the short-range period (through 2018), the age-sex-adjusted death rate (adjusted to the 2000 disabled-worker population) under the intermediate assumptions is projected to gradually decline from 27.7 deaths per thousand beneficiaries in 2008 to about 23.6 per thousand by 2018. ${ }^{1}$ The age-sexadjusted recovery rate under the intermediate assumptions is assumed to rise from a relatively low level of 10.5 per thousand beneficiaries in 2008 (reflecting temporarily lower levels of continuing disability reviews) to 11.5 per thousand beneficiaries by 2018. Under low-cost (high-cost) assumptions, total age-sex-adjusted termination rates due to death and recovery are assumed to increase (decrease) to levels roughly 10-16 percent higher (lower) than those under the intermediate assumptions.

For the long-range period (post-2018), death and recovery rates are projected relative to rates by age, sex, and duration of entitlement over the base period 1996-2000. ${ }^{2}$ The ultimate age-sex-adjusted recovery rate for disabled workers is assumed to be about 10.8 per thousand beneficiaries. Ultimate age-sexadjusted recovery rates for low-cost and high-cost alternatives are assumed to reach about 13.1 and 8.6 recoveries per thousand beneficiaries, respectively. For all three sets of assumptions, the ultimate recovery rates are reached in the twentieth year of the projection period (2028). In contrast, death rates by age and sex are assumed to change throughout the long-range period at the same rate as for death rates in the general population. From the age-sex- adjusted death rate of 27.7 per thousand beneficiaries in 2008, rates of $20.3,11.4$, and 7.3 per thousand disabled-worker beneficiaries are projected for 2085 under the low-cost, intermediate, and high-cost assumptions, respectively.

Figure V.C4 illustrates gross and age-sex-adjusted total termination rates for disabled-worker beneficiaries for the historical period since 1970, and for the projection period through 2085. In the near term, between 2011 and 2014, recovery terminations are projected to be elevated as SSA works down the current pending backlog of continuing disability reviews. As with incidence rates, the age-sex-adjusted termination rate provides an illustration of the real change in the tendency to terminate benefits. The gross rate is influenced by changes in the age-sex distribution of the beneficiary population. A shift in

[^15]the beneficiary population to older ages, as when the baby-boom generation moves into pre-retirement ages, results in an increase in the gross death termination rate as long as death rates by age and sex are constant or declining.

Figure V.C4.-DI Disability Termination Rates, 1970-2085
[Terminations per thousand disabled-worker beneficiaries]

## c. Comparison of Incidence, Termination, and Conversion

Incidence and termination rates are the foundation for development of the projected levels of disabled-worker beneficiaries in current-payment status up to the normal retirement age (NRA) at which time beneficiaries are converted to retired-worker status and thereby leave the DI rolls. For all dis-abled-worker beneficiaries reaching the NRA in a given year, the disability "conversion" rate is, by definition 100 percent. For beneficiaries at all other ages this rate is zero. Conversions are simply a transfer of beneficiaries at NRA from the DI Trust Fund account to the OASI Trust Fund account. After conversion, recovery from the disabling condition is no longer considered. Conversions do represent a form of exit from the DI rolls and therefore must be accounted for in disabled-worker beneficiary totals.

Figure V.C5 compares the historical and projected (intermediate) levels of incidence, termination, and conversion on both gross and age-sex-adjusted bases. The rates for incidence and termination (death and recovery) are described above. The conversion ratio is the number of conversions in a
given year (i.e., beneficiaries who reach the NRA) divided by the average number of disabled-worker beneficiaries at all ages in that year. The ratio is a constant on an age-sex-adjusted basis, except for the two periods during which the NRA increases under current law. But on a gross basis, the conversion ratio rises and falls with the changing proportion of all disabled-worker beneficiaries who attain the NRA in a given year.

Termination rates have declined and are expected to continue to fall, largely because of declines in death rates. Incidence rates have varied widely and are assumed for the intermediate projection (on an age-sex-adjusted basis) to remain near the middle of the high and low extremes experienced since 1970. The gross conversion ratio increases in the future due to aging of the beneficiary population.

Figure V.C5.-Comparison of DI Disability Incidence Rates, Termination Rates and Conversion Ratios Under Intermediate Assumptions, 1970-2085
[Awards per thousand disability exposed;
terminations and conversions per thousand disabled-worker beneficiaries]

## d. DI Beneficiaries and Disability Prevalence Rates

The detailed projections of disabled-worker awards, terminations, and conversions are combined using standard actuarial methods to project the number of disabled workers receiving benefits (i.e., in current-payment status) over the next 75 years. The projected numbers of disabled workers in cur-rent-payment status are presented in table V.C5. The number of disabled
workers in current-payment status is projected to grow from 7.4 million at the end of 2008 , to 12.0 million, 13.9 million, and 14.7 million at the end of 2085, under the low-cost, intermediate, and high-cost assumptions, respectively. Of course, much of this growth is a direct result of the growth and aging of the population described earlier in this chapter. Also shown in table V.C5 are disability prevalence rates on both gross and age-sex-adjusted bases. Discussion of auxiliary beneficiary projections appears below.

| Calendar year | Disabledworker beneficiaries | Auxiliary beneficiaries |  | Total beneficiaries | Disability prevalence rates |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  | Spouse | Child |  | Gross | Age-sexadjusted |

| 2085. . . . . . . . | 14,737 | 306 | 2,544 | 17,587 | 79 | 62 |

Note: Totals do not necessarily equal the sums of rounded components.

Figure V.C6 illustrates the historical and projected disability prevalence rates on both a gross basis and on an age-sex-adjusted basis (adjusted to the agesex distribution of the insured population for the year 2000).

Figure V.C6.-DI Disability Prevalence Rates, 1970-2085
[Rate per thousand disability insured]

Changes in prevalence rates are a direct result of changes in incidence rates and termination rates. The patterns depicted for these rates in figure V.C5 are helpful for understanding the trend in prevalence rates. (Annual rates are not directly comparable and cannot be simply combined because their denominators differ.)

Prevalence rates have increased primarily because: (1) termination rates have declined; and (2) incidence rates at younger ages have increased relative to rates at higher ages. Gross prevalence rates have increased more than age-sex-adjusted prevalence rates since the baby-boom generation began to move into the ages 50 through NRA, where incidence rates are relatively high. With this upward shift in the age distribution of the disabled population, gross conversions to retired worker status at NRA have naturally increased as well. In the future, prevalence rates are projected to grow at a slower pace reflecting assumed stabilization in three factors: the age distribution of the general population, the age distribution of the disability insured population, and relative rates of incidence by age. With these factors gradually stabiliz-

## Assumptions \& Methods

ing, the remaining force influencing prevalence rates is the declining death termination rate, which is projected to continue to have a small influence toward higher disability prevalence rates in the future.

As mentioned above in the discussion of incidence and termination rates, the age-sex-adjusted prevalence rate isolates the changing trend in the true likelihood of receiving benefits for the insured population, free from the effects of an aging population. For disability prevalence rates, like incidence rates, the entrance of the baby-boom generation into working ages caused the gross rate of disability to decline relative to the age-sex-adjusted rate between 1975 and 1995, due to lower disability prevalence rates at younger ages. Conversely, the gross rate of disability prevalence increases relative to the age-sex-adjusted rate after 1995 due to the aging of the baby-boom generation into ages with higher disability prevalence rates.

The age-sex-adjusted disability prevalence rate for ages through 64 is projected to grow from 41.3 per thousand disability insured at the end of 2008, to 50.0 per thousand at the end of 2085 under the intermediate assumptions. As mentioned above, the growth in prevalence is expected to slow relative to the historical period.

Under the low-cost and high-cost assumptions, the age-sex-adjusted disability prevalence rate is projected to decrease to 37.7 per thousand and increase to 62.5 per thousand insured workers at the end of 2085, respectively.

Table V.C5 presents projections of the numbers of auxiliary beneficiaries paid from the DI Trust Fund. As indicated at the beginning of this subsection, such auxiliary beneficiaries consist of qualifying spouses and children of disabled workers. In the case of children, the child must be either (1) under age 18, (2) age 18 or 19 and still a student in high school, or (3) over age 18 and disabled prior to age 22. In the case of spouses, the spouse must either be at least age 62, or have, in his or her care, an eligible child beneficiary who is either under age 16 or disabled prior to age 22.

In general, the number of such auxiliary beneficiaries is projected in a manner that is related to the projected number of disabled-worker beneficiaries. In the short-range period (2009-18), this is accomplished for family members of disabled-worker beneficiaries by projecting incidence and termination rates for each category of auxiliary beneficiary. After 2018, the child beneficiaries at ages 18 and under are projected in relation to the projected number of children in the population, by applying factors representing the probability that either of their parents is a disabled-worker beneficiary. The remaining categories of children and spouses are projected in a similar manner.

## 7. Average Benefits

Average benefits are projected by type of benefit based on recent historical averages, projected average primary insurance amounts (PIAs), and projected ratios of average benefits to average PIAs. Average PIAs are calculated from projected distributions of beneficiaries by duration from year of initial entitlement, average PIAs at initial entitlement, and increases in PIAs since the year of initial entitlement, reflecting automatic benefit increases, recomputations to reflect additional covered earnings, and other factors. Future average PIAs at initial entitlement are calculated from projected earnings histories, which are developed using a combination of the actual earnings histories associated with a sample of 2004 initial entitlements, and more recent actual earnings levels by age and sex for covered workers.

For several types of benefits-retired-worker, aged-spouse, and agedwidow(er) benefits-the percentage of the PIA that is payable depends on the age at initial entitlement to benefits. Projected ratios of average benefits to average PIAs for these types of benefits are based on projections of age distributions at initial entitlement.

## 8. Benefit Payments

For each type of benefit, benefit payments are calculated as the product of a number of beneficiaries and a corresponding average monthly benefit. In the short-range period, benefit payments are calculated on a quarterly basis. In the long-range period, all benefit payments are calculated on an annual basis, using the number of beneficiaries on December 31. These amounts are adjusted to include retroactive payments to newly awarded beneficiaries, and other amounts not reflected in the regular monthly benefit payments.

Lump-sum death payments are calculated as the product of (1) the number of such payments, which is projected on the basis of the assumed death rates, the projected fully insured population, and the estimated percentage of the fully insured population that would qualify for benefits, and (2) the amount of the lump-sum death payment, which is $\$ 255$ (not indexed in future years).

## 9. Administrative Expenses

The projection of administrative expenses through 2018 is based on historical experience and the expected growth in average wages. Additionally, estimates for the first several years of the projection are provided by the Office of Budget of the Social Security Administration. For years after 2018, administrative expenses are assumed to increase because of increases in the

## Assumptions \& Methods

number of beneficiaries and increases in the average wage, which will more than offset assumed improvements in administrative productivity.

## 10. Railroad Retirement Financial Interchange

Railroad workers are covered under a separate multi-tiered plan, the first tier being very similar to OASDI coverage. An annual financial interchange between the Railroad Retirement fund and the OASI and DI funds is made reflecting the difference between: (1) the amount of OASDI benefits that would be paid to railroad workers and their families if railroad employment had been covered under the OASDI program and administrative expenses associated with these benefits; and (2) the amount of OASDI payroll tax and income tax that would be received with allowances for interest from railroad workers.

The effect of the financial interchange with the Railroad Retirement program is evaluated on the basis of trends similar to those used in estimating the cost of OASDI benefits. The resulting effect is annual short-range costs of about $\$ 4-5$ billion and a long-range summarized cost of 0.04 percent of taxable payroll to the OASDI program.

## 11. Military Service Transfers

Beginning in 1966, the OASI and DI Trust Funds were reimbursed annually for the cost (including administrative expenses) of providing additional benefit payments resulting from noncontributory wage credits for military service performed prior to 1957. The 1983 amendments modified the reimbursement mechanism and the timing of the reimbursements, and required a transfer in 1983 to include all future costs attributable to the wage credits. The amendments also require adjustments to that 1983 transfer every fifth year, beginning with 1985, to account for actual data.

## 12. Income From Taxation of Benefits

Under present law, the OASI and DI Trust Funds are credited with the additional income taxes attributable to the taxation of up to the first 50 percent of OASI and DI benefit payments. (The remainder of the income taxes attributable to the taxation of up to 85 percent of OASI and DI benefit payments is credited to the HI Trust Fund.)

For the short-range period, income to the trust funds from such taxation is estimated by applying the following two factors to total OASI and DI benefit payments: (1) the percentage of benefit payments (limited to 50 percent) that is taxable; and (2) the average marginal tax rate applicable to those benefits.

For the long-range period, income to the trust funds from such taxation is estimated by applying projected ratios of taxation of OASI and DI benefits to total OASI and DI benefit payments. Because the income thresholds used for benefit taxation are, by law, constant in the future, their values in relation to future income and benefit levels will decline. Thus, ratios of income from taxation of benefits to the amount of benefits are projected to increase gradually. Ultimate tax ratios for OASI and DI benefits used in the projection are based on information from the Office of Tax Analysis (OTA) in the Department of the Treasury, by eliminating the current threshold amounts completely for taxation of Social Security benefits in its tax model. Subsequently, based on recent Current Population Survey data, the Office of the Chief Actuary makes a downward adjustment to OTA's ultimate ratios for relative changes in the projected 75th year OASDI beneficiary population in the most recent Trustees Report.

## Appendices

## VI. APPENDICES

## A. HISTORY OF OASI AND DI TRUST FUND OPERATIONS

The Federal Old-Age and Survivors Insurance (OASI) Trust Fund was established on January 1, 1940 as a separate account in the United States Treasury. The Federal Disability Insurance (DI) Trust Fund, another separate account in the United States Treasury, was established on August 1, 1956. All the financial operations of the OASI and DI programs are handled through these respective funds. The Board of Trustees is responsible for overseeing the financial operations of these funds. The following paragraphs describe the various components of trust fund income and outgo. Following this description, tables VI.A2 and VI.A3 present the historical operations of the separate trust funds since their inception, and table VI.A4 presents the operations of the combined trust funds during the period when they have co-existed.

The primary receipts of these two funds are amounts appropriated to each of them under permanent authority on the basis of contributions payable by workers, their employers, and individuals with self-employment income, in work covered by the OASDI program. All employees, and their employers, in covered employment are required to pay contributions with respect to their wages. Employees, and their employers, are also required to pay contributions with respect to cash tips, if the individual's monthly cash tips amount to at least $\$ 20$. All self-employed persons are required to pay contributions with respect to their covered net earnings from self-employment. In addition to paying the required employer contributions on the wages of covered Federal employees, the Federal Government also pays amounts equivalent to the combined employer and employee contributions that would be paid on deemed wage credits attributable to military service performed between 1957 and 2001 if such wage credits were covered wages.

In general, an individual's contributions, or taxes, are computed on wages or net earnings from self-employment, or both wages and net self-employment earnings combined, up to a specified maximum annual amount. The contributions are determined first on the wages and then on any net self-employment earnings, such that the total does not exceed the annual maximum amount. An employee who pays contributions on wages in excess of the annual maximum amount (because of employment with two or more employers) is eligible for a refund of the excess employee contributions.

The monthly benefit amount to which an individual (or his or her spouse and children) may become entitled under the OASDI program is based on the individual’s taxable earnings during his or her lifetime. For almost all per-
sons who first become eligible to receive benefits in 1979 or later, the earnings used in the computation of benefits are indexed to reflect increases in average wage levels.

The contribution, or tax, rates applicable under current law in each calendar year and the allocation of these rates between the OASI and DI Trust Funds are shown in table VI.A1. ${ }^{1}$ The maximum amount of earnings on which OASDI contributions are payable in a year, which is also the maximum amount of earnings creditable in that year for benefit-computation purposes, is called the contribution and benefit base. The contribution and benefit base for each year through 2009 is also shown in table VI.A1.

Table VI.A1.-Contribution and Benefit Base and Contribution Rates

${ }^{\text {a }}$ In 1984 only, an immediate credit of 0.3 percent of taxable wages was allowed against the OASDI contributions paid by employees, which resulted in an effective contribution rate of 5.4 percent. The appropriations of contributions to the trust funds, however, were based on the combined employee-employer rate of 11.4 percent, as if the credit for employees did not apply. Similar credits of 2.7 percent, 2.3 percent, and 2.0 percent were allowed against the combined OASDI and Hospital Insurance (HI) contributions on net earnings from selfemployment in 1984, 1985, and 1986-89, respectively. Beginning in 1990, self-employed persons are allowed a deduction, for purposes of computing their net earnings, equal to half of the combined OASDI and HI contributions that would be payable without regard to the contribution and benefit base. The OASDI contribution rate is then applied to net earnings after this deduction, but subject to the OASDI base.
${ }^{\mathrm{b}}$ Subject to automatic adjustment based on increases in average wages.
All contributions are collected by the Internal Revenue Service and deposited in the General Fund of the Treasury. The contributions are immediately and automatically appropriated to the trust funds on an estimated basis. The exact amount of contributions received is not known initially because the OASDI and HI contributions and individual income taxes are not separately identified in collection reports received by the Internal Revenue Service. Periodic adjustments are subsequently made to the extent that the estimates are found to differ from the amounts of contributions actually payable as determined from reported earnings. Adjustments are also made to account for any refunds to employees (with more than one employer) who paid contributions on wages in excess of the contribution and benefit base.

Beginning in 1984, up to one-half of an individual's or couple's OASDI benefits was subject to Federal income taxation under certain circumstances.

Effective for taxable years beginning after 1993, the maximum percentage of benefits subject to taxation was increased from 50 percent to 85 percent. The proceeds from taxation of up to 50 percent of benefits are credited to the OASI and DI Trust Funds in advance, on an estimated basis, at the beginning of each calendar quarter, with no reimbursement to the general fund for interest costs attributable to the advance transfers. ${ }^{1}$ Subsequent adjustments are made based on the actual amounts as shown on annual income tax records. The amounts appropriated from the General Fund of the Treasury are allocated to the OASI and DI Trust Funds on the basis of the income taxes paid on the benefits from each fund. ${ }^{2}$

Another source of income to the trust funds is interest received on investments held by the trust funds. That portion of each trust fund that is not required to meet the current cost of benefits and administration is invested, on a daily basis, primarily in interest-bearing obligations of the U.S. Government (including special public-debt obligations described below). Investments may also be made in obligations guaranteed as to both principal and interest by the United States, including certain Federally sponsored agency obligations that are designated in the laws authorizing their issuance as lawful investments for fiduciary and trust funds under the control and authority of the United States or any officer of the United States. These obligations may be acquired on original issue at the issue price or by purchase of outstanding obligations at their market price.

The Social Security Act authorizes the issuance of special public-debt obligations for purchase exclusively by the trust funds. The Act provides that the interest rate on new special obligations will be the average market yield, as of the last business day of a month, on all of the outstanding marketable U.S. obligations that are due or callable more than 4 years in the future. The rate so calculated is rounded to the nearest one-eighth of one percent and applies to new issues in the following month. Beginning January 1999, in calculating the average market yield rate for this purpose, the Treasury incorporates the yield to the call date when a callable bond's market price is above par.

Although the special issues cannot be bought or sold in the open market, they are nonetheless redeemable at any time at par value and thus bear no risk of fluctuations in principal value due to changes in market yield rates. Just as in the case of marketable Treasury securities held by the public, all of the

[^17]
## Appendices

investments held by the trust funds are backed by the full faith and credit of the U.S. Government.

Income is also affected by provisions of the Social Security Act for: (1) transfers between the General Fund of the Treasury and the OASI and DI Trust Funds for any adjustments to prior payments for the cost arising from the granting of noncontributory wage credits for military service prior to 1957, according to periodic determinations; and (2) the receipt of unconditional money gifts or bequests made for the benefit of the trust funds or any activity financed through the funds.

The primary expenditures of the OASI and DI Trust Funds are for: (1) OASDI benefit payments, net of any reimbursements from the General Fund of the Treasury for unnegotiated benefit checks; and (2) expenses incurred by the Social Security Administration and the Department of the Treasury in administering the OASDI program and the provisions of the Internal Revenue Code relating to the collection of contributions. Such administrative expenses include expenditures for construction, rental and lease, or purchase of office buildings and related facilities for the Social Security Administration. The Social Security Act does not permit expenditures from the OASI and DI Trust Funds for any purpose not related to the payment of benefits or administrative costs for the OASDI program.

The expenditures of the trust funds also include (1) the costs of vocational rehabilitation services furnished as an additional benefit to disabled persons receiving cash benefits because of their disabilities where such services contributed to their successful rehabilitation, and (2) net costs resulting from the provisions of the Railroad Retirement Act which provide for a system of coordination and financial interchange between the Railroad Retirement program and the Social Security program. Under the latter provisions, transfers between the Railroad Retirement program's Social Security Equivalent Benefit Account and the trust funds are made on an annual basis in order to place each trust fund in the same position in which it would have been if railroad employment had always been covered under Social Security.

The net worth of facilities and other fixed capital assets is not carried in the statements of the operations of the trust funds presented in this report. This is because the value of fixed capital assets is not available in the form of a financial asset redeemable for the payment of benefits or administrative expenditures, and therefore is not considered in assessing the actuarial status of the trust funds.

${ }^{\text {a }}$ Includes payments from the General Fund of the Treasury to the trust funds (1) in 1947-51 and in 1966 and later, costs of noncontributory wage credits for military service performed before 1957; (2) in 1971-82, costs of deemed wage credits for military service performed after 1956; and (3) in 1968 and later, costs of benefits to certain uninsured persons who attained age 72 before 1968. Differences in past year total income and sum of individual column amounts are due to these payments. OASI historical payments from the General Fund of the Treasury may be found on the Internet at www.socialsecurity.gov/OACT/STATS/table4a1.html.
Beginning in 1983, includes transfers from the General Fund of the Treasury representing contributions that would have been paid on deemed wage credits for military service in 1957 through 2001, if such credits were considered to be covered wages.
${ }^{\text {c }}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, administrative expenses are charged to the trust fund on an estimated basis, with a final adjustment, including interest, made in the following fiscal year. The amounts of these interest adjustments are included in net interest. For years prior to 1967, a description of the method of accounting for administrative expenses is contained in the 1970 Annual Report. Beginning in October 1973, the figures shown include relatively small amounts of gifts to the fund. Net interest for 1983-86 reflects payments from a borrowing trust fund to a lending trust fund for interest on amounts owed under the interfund borrowing provisions. During 1983-90, interest paid from the trust fund to the general fund on advance tax transfers is reflected. The amount shown for 1985 includes an interest adjustment of \$88 million on unnegotiated checks issued before April 1985.
${ }^{\mathrm{d}}$ Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, amounts are reduced by amount of reimbursement for unnegotiated benefit checks.
e The "Trust fund ratio" column represents assets at the beginning of a year as a percentage of expenditures during the year. For 1937 no ratio is shown because no assets existed at the beginning of the year. For years 198490 , assets at the beginning of a year include January advance tax transfers.
${ }^{\mathrm{f}}$ Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\mathrm{g}}$ Reflects offset for repayment from the OASI Trust Fund of amounts borrowed from the DI and HI Trust Funds in 1982. The amount repaid in 1985 was $\$ 4.4$ billion; in 1986 , the amount was $\$ 13.2$ billion.
Note: Totals do not necessarily equal the sums of rounded components.

${ }^{\text {a }}$ Includes payments from the General Fund of the Treasury to the trust funds (1) beginning in 1966 and later costs of noncontributory wage credits for military service performed before 1957 and (2) in 1971-82, costs of deemed wage credits for military service performed after 1956. Differences in past year total income and sum of individual column amounts are due to these payments. DI historical payments from the General Fund of the Treasury may be found on the Internet at www.socialsecurity.gov/OACT/STATS/table4a2.html.
${ }^{\mathrm{b}}$ Beginning in 1983, includes transfers from the General Fund of the Treasury representing contributions that would have been paid on deemed wage credits for military service in 1957 through 2001, if such credits were considered to be covered wages.
${ }^{\text {c }}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, administrative expenses are charged to the trust fund on an estimated basis, with a final adjustment, including interest, made in the following fiscal year. The amounts of these interest adjustments are included in net interest. For years prior to 1967, a description of the method of accounting for administrative expenses is contained in the 1970 Annual Report. Beginning in July 1974, the figures shown include relatively small amounts of gifts to the fund. Net interest for 1983-86 reflects payments from a borrowing trust fund to a lending trust fund for interest on amounts owed under the interfund borrowing provisions. During 1983-90, interest paid from the trust fund to the general fund on advance tax transfers is reflected. The amount shown for 1985 includes an interest adjustment of \$14.8 million on unnegotiated checks issued before April 1985.
Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, amounts are reduced by amount of reimbursement for unnegotiated benefit checks.
${ }^{e}$ The "Trust fund ratio" column represents assets at the beginning of a year as a percentage of expenditures during the year. For 1957 no ratio is shown because no assets existed at the beginning of the year. For years 1984-
90 , assets at the beginning of a year include January advance tax transfers.
${ }^{5}$ Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\mathrm{g}}$ Reflects offset for repayment from the OASI Trust Fund of amounts borrowed from the DI Trust Fund in 1982. An amount of $\$ 2.5$ billion was repaid in each year 1985 and 1986.
Note: Totals do not necessarily equal the sums of rounded components.

| 2005 | \$701.8 | \$592.9 | \$14.9 | \$94.3 | \$529.9 | \$520.7 | \$5.3 | \$3.9 | \$171.8 | \$1,858.7 | 318 |
| 2006 | 744.9 | 625.6 | 16.9 | 102.4 | 555.4 | 546.2 | 5.3 | 3.8 | 189.5 | 2,048.1 | 335 |
| 2007 | 784.9 | 656.1 | 18.6 | 110.2 | 594.5 | 584.9 | 5.5 | 4.0 | 190.4 | 2,238.5 | 345 |
| 2008 | 805.3 | 672.1 | 16.9 | 116.3 | 625.1 | 615.3 | 5.7 | 4.0 | 180.2 | 2,418.7 | 358 |

${ }^{\text {a }}$ Includes payments from the General Fund of the Treasury to the trust funds (1) beginning in 1966 and later, costs of noncontributory wage credits for military service performed before 1957; (2) in 1971-82, costs of deemed wage credits for military service performed after 1956; and (3) in 1968 and later, costs of benefits to certain uninsured persons who attained age 72 before 1968. Differences in past year total income and sum of individual column amounts are due to these payments. OASDI historical payments from the General Fund of the Treasury may be found on the Internet at www.socialsecurity.gov/OACT/STATS/table4a3.html.
${ }^{\mathrm{b}}$ Beginning in 1983, includes transfers from the General Fund of the Treasury representing contributions that would have been paid on deemed wage credits for military service in 1957 through 2001, if such credits were considered to be covered wages.
${ }^{\text {c }}$ Net interest includes net profits or losses on marketable investments. Beginning in 1967, administrative expenses are charged to the trust funds on an estimated basis, with a final adjustment, including interest, made in the following fiscal year. The amounts of these interest adjustments are included in net interest. For years prior to 1967, a description of the method of accounting for administrative expenses is contained in the 1970 Annual Report. Beginning in October 1973, the figures shown include relatively small amounts of gifts to the funds. Net interest for 1983-86 reflects payments from a borrowing trust fund to a lending trust fund for interest on amounts owed under the interfund borrowing provisions. During 1983-90, interest paid from the trust funds to the general fund on advance tax transfers is reflected. The amount shown for 1985 includes an interest adjustment of \$102.8 million on unnegotiated checks issued before April 1985.
${ }^{\text {d }}$ Beginning in 1966, includes payments for vocational rehabilitation services furnished to disabled persons receiving benefits because of their disabilities. Beginning in 1983, amounts are reduced by amount of reimbursement for unnegotiated benefit checks.
${ }^{e}$ The "Trust fund ratio" column represents assets at the beginning of a year as a percentage of expenditures during the year. For years 1984-90, assets at the beginning of a year include January advance tax transfers.
${ }^{\mathrm{f}}$ Between - $\$ 50$ million and $\$ 50$ million.
${ }^{\mathrm{g}}$ Reflects offset for repayment from the OASI Trust Fund of amounts borrowed from the HI Trust Fund in 1982. The amount repaid in 1985 was $\$ 1.8$ billion; in 1986, the amount was $\$ 10.6$ billion.
Note: Totals do not necessarily equal the sums of rounded components.

Tables VI.A5 and VI.A6 show the total assets of the OASI Trust Fund and the DI Trust Fund, respectively, at the end of each of the calendar years 2007 and 2008. These assets are separated by interest rate and year of maturity. Assets grouped with multiple years of maturity are distributed evenly across those years. Bonds issued to the trust funds in 2008 had an interest rate of 4 percent, compared with an interest rate of 5 percent for bonds issued in 2007.

Note: Amounts of special issues are shown at par value. Special issues are always purchased and redeemed at par value. Where equal amounts mature in two or more years at a given interest rate, they are grouped. An undisbursed balance, if negative, represents an extension of credit against securities to be redeemed within the following few days.

## B. HISTORY OF ACTUARIAL BALANCE ESTIMATES

This appendix chronicles the history of the principal summary measure of long-range actuarial status, namely the actuarial balance, since 1983. The 1983 report was the last report for which the actuarial balance was positive. Actuarial balance is defined in detail in section IV.B. 4 Summarized Income Rates, Cost Rates, and Balances. Conceptually, the two basic components of actuarial balance are the summarized income rate and the summarized cost rate. Both rates are expressed as percentages of taxable payroll. For any given period, the actuarial balance is the difference between the present value of tax income for the period, and the present value of the cost for the period, each divided by the present value of taxable payroll for all years in the period. Also included in the calculation of the actuarial balance are:

- The amount of the trust fund balances on hand at the beginning of the valuation period, as shown in the reports for 1988 and later, and
- The present value of a target trust fund balance equal to 100 percent of the amount of annual cost to be reached and maintained by the end of the valuation period, as shown in the reports for 1991 and later.
It should be noted that the current method of calculating the actuarial balance based on present values, though used prior to the 1973 Annual Report, was not used for the annual reports of 1973-87. Instead, a simpler method that approximates the results of the present-value approach, called the averagecost method, was used during that period. Under the average-cost method, the sum of the annual cost rates (which are expressed as percentages of taxable payroll) over the 75 -year projection period was divided by the total number of years, 75 , to obtain the average cost rate per year. The average income rate was similarly calculated, and the difference between the average income rate and the average cost rate was called the actuarial balance.

In 1973, when the average-cost method was first used, the long-range financing of the program was more nearly on a pay-as-you-go basis. Also, based on the long-range demographic and economic assumptions then being used, the annual rate of growth in taxable payroll was about the same as the annual rate at which the trust funds earned interest. In either situation (i.e., pay-as-you-go financing, where the annual income rate is the same as the annual cost rate, or an annual rate of growth in taxable payroll equal to the annual interest rate), the average-cost method produces the same result as the present-value method. However, by 1988, neither of these situations still existed.

## Appendices

As a result of legislation enacted in 1977 and in 1983, substantial increases in the trust funds were estimated to occur well into the 21st century, so that the program was partially advance funded, rather than being funded on a pay-as-you-go basis. Also, because of reductions in long-range fertility rates and average real-wage growth that were assumed in the annual reports over the period 1973-87, the annual rate of growth in taxable earnings assumed for the long range became significantly lower than the assumed interest rate. Therefore, during the period 1973-87, the results of the average-cost method and the present-value method began to diverge, and by 1988 they were quite different. While the average-cost method still accounted for most of the effects of the assumed interest rate, it no longer accounted for all of the interest effects. The present-value method, of course, does account for the full effect of the assumed interest rates. So, in 1988, the present-value method of calculating the actuarial balance was reintroduced.

A positive actuarial balance indicates that estimated income is more than sufficient to meet estimated trust fund obligations for the period as a whole. A negative actuarial balance indicates that estimated income is insufficient to meet estimated trust fund obligations for the entire period. An actuarial balance of zero indicates that the estimated income exactly matches estimated trust fund obligations for the period.

Table VI.B1 shows the estimated OASDI actuarial balances, as well as the summarized income and cost rates, for the annual reports 1982-2008, along with the estimates for the current report. The values shown are based on the alternative II assumptions, or alternative II-B for years prior to 1991.

|  | Year of report | Summarized income rate | Summarized cost rate | Actuarial balance | Change from previous year |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 1982 |  | 12.27 | 14.09 | -1.82 | b |
| 1983 |  | 12.87 | 12.84 | +. 02 | +1.84 |
| 1984 |  | 12.90 | 12.95 | -. 06 | -. 08 |
| 1985 |  | 12.94 | 13.35 | -. 41 | -. 35 |
| 1986 |  | 12.96 | 13.40 | -. 44 | -. 03 |
| 1987 |  | 12.89 | 13.51 | -. 62 | -. 18 |
| 1988 |  | 12.94 | 13.52 | -. 58 | +. 04 |

| 1990 |  | 13.04 | 13.95 | -. 91 | -. 21 |
| 1991 |  | 13.11 | 14.19 | -1.08 | -. 17 |
| 1992 |  | 13.16 | 14.63 | -1.46 | -. 38 |
| 1993 |  | 13.21 | 14.67 | -1.46 |  |
| 1994 |  | 13.24 | 15.37 | -2.13 | -. 66 |
| 1995 |  | 13.27 | 15.44 | -2.17 | -. 04 |
| 1996 |  | 13.33 | 15.52 | -2.19 | -. 02 |
| 1997 |  | 13.37 | 15.60 | -2.23 | -. 03 |
| 1998 |  | 13.45 | 15.64 | -2.19 | +. 04 |
| 1999 |  | 13.49 | 15.56 | -2.07 | +. 12 |
| 2000 |  | 13.51 | 15.40 | -1.89 | +. 17 |
| 2001 |  | 13.58 | 15.44 | -1.86 | +. 03 |
| 2002 |  | 13.72 | 15.59 | -1.87 | -. 01 |
| 2003 |  | 13.78 | 15.70 | -1.92 | -. 04 |
| 2004 |  | 13.84 | 15.73 | -1.89 | +. 03 |
| 2005 |  | 13.87 | 15.79 | -1.92 | -. 04 |
| 2006 |  | 13.88 | 15.90 | -2.02 | -. 09 |
| 2007 |  | 13.92 | 15.87 | -1.95 | +. 06 |
| 2008 |  | 13.94 | 15.63 | -1.70 | +. 26 |
| 2009 | . . . . . . . . | 14.02 | 16.02 | -2.00 | -. 30 |

${ }^{\text {a }}$ Values shown are based on the alternative II assumptions for 1991-2009, and on the alternative II-B assumptions for 1982-90.
${ }^{\mathrm{b}}$ Between -0.005 and 0.005 percent of taxable payroll.
Note: Totals do not necessarily equal the sums of rounded components.
For several of the years included in the table, significant legislative changes or definitional changes affected the estimated actuarial balance. The Social Security Amendments of 1983 accounted for the largest single change in recent history. The actuarial balance of -1.82 for the 1982 report improved to +0.02 for the 1983 report. In 1985, the estimated actuarial balance changed largely because of an adjustment made to the method for estimating the age distribution of immigrants.

Rebenchmarking of the National Income and Product Accounts and changes in demographic assumptions contributed to the change in the actuarial balance for 1987. Various changes in assumptions and methods for the 1988 report had roughly offsetting effects on the actuarial balance. In 1989 and

## Appendices

1990, changes in economic assumptions accounted for most of the changes in the estimated actuarial balance.

In 1991, the effect of legislation, changes in economic assumptions, and the introduction of the cost of reaching and maintaining an ending trust fund target combined to produce the change in the actuarial balance. In 1992, changes in disability assumptions and the method for projecting average benefit levels accounted for most of the change in the actuarial balance. In 1993, numerous small changes in assumptions and methods had offsetting effects on the actuarial balance. In 1994, changes in the real-wage assumptions, disability rates, and the earnings sample used for projecting average benefit levels accounted for most of the change in the actuarial balance. In 1995, numerous small changes had largely offsetting effects on the actuarial balance, including a substantial reallocation of the payroll tax rate, which reduced the OASI actuarial balance, but increased the DI actuarial balance.

In 1996, a change in the method of projecting dually-entitled beneficiaries produced a large increase in the actuarial balance, which almost totally offset decreases produced by changes in the valuation period and in the demographic and economic assumptions. Various changes in assumptions and methods for the 1997 report had roughly offsetting effects on the actuarial balance. In 1998, increases caused by changes in the economic assumptions, although partially offset by decreases produced by changes in the valuation period and in the demographic assumptions, accounted for most of the changes in the estimated actuarial balance. In 1999, increases caused by changes in the economic assumptions (related to improvements in the CPI by the Bureau of Labor Statistics) accounted for most of the changes in the estimated actuarial balance. For the 2000 report, changes in the actuarial balance resulted from changes in economic assumptions and methodology; however, these increases in the balance were partially offset by reductions caused by the change in valuation period and changes in demographic assumptions.

For the 2001 report, increases caused by changes in the demographic starting values, although partially offset by a decrease produced by the change in the valuation period, accounted for most of the changes in the estimated actuarial balance. For the 2002 report, the changes in the valuation period and the demographic assumptions-both decreases in the actuarial balance-were offset by changes in the economic assumptions, while the increase due to disability assumptions was slightly more than offset by the decrease due to changes in the projection methods and data. For the 2003 report, the increase due to the change in program assumptions was more than offset by decreases due to the change in valuation period and changes in demographic assumptions. For the 2004 report, increases due to changing the method of project-
ing benefit levels for higher earners more than offset decreases in the actuarial balance arising from the change in the valuation period and the net effect of other changes in programmatic data and methods. For the 2005 report, the increase due to changing the method of projecting future average benefit levels was more than offset by decreases due to changes in the valuation period, updated starting values for the economic assumptions, and other methodological changes.

In 2006, decreases in the actuarial balance due to the change in the valuation period, a reduction in the ultimate annual real interest rate, and improvements in calculating mortality for disabled workers, were greater in aggregate than increases in the actuarial balance due to changes in demographic starting values and the ultimate total fertility rate, as well as other programmatic data and method changes. For the 2007 report, increases in the actuarial balance arising from revised disability incidence rate assumptions, improvements in average benefit level projections, and changes in near-term economic projections, more than offset decreases in the balance due to the valuation period change and updated historical mortality data. For the 2008 report, the large increase in the actuarial balance was primarily due to changes in immigration methods and assumptions. These changes more than offset the decreases in the actuarial balance due to the change in the valuation period and the lower starting and ultimate mortality rates.

Changes affecting the actuarial balance shown for the 2009 report are described in section IV.B. 7 Reasons for Change in Actuarial Balance From Last Report.

## Appendices

## C. FISCAL YEAR HISTORICAL DATA AND PROJECTIONS THROUGH 2018

Tables VI.C1, VI.C2, and VI.C3 present detailed operations of the OASI, DI, and the combined OASI and DI Trust Funds, respectively, for fiscal year 2008, the most recent fiscal year for which complete actual information is available. These tables are similar to the calendar year operations tables in section III.A. Please see that section for a description of the various items of income and outgo.

| Total assets, September 30, 2007 |  | \$1,967,042 |

a "Total Income" column includes transfers made between the OASI Trust Fund and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for (1) the cost of noncontributory wage credits for military service before 1957, and (2) the cost of benefits to certain uninsured persons who attained age 72 before 1968. In December 2005, $\$ 350$ million was transferred from the OASI Trust Fund to the General Fund of the Treasury for the cost of pre-1957 military service wage credits. After 2007 such transfers are estimated to be less than $\$ 500,000$ in each year.
b The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year. Note: Totals do not necessarily equal the sums of rounded components.

a "Total Income" column includes transfers made between the DI Trust Fund and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for the cost of noncontributory wage credits for military service before 1957. In particular, a transfer was made in December 2007 in the amount of $\$ 7.7$ million from the General Fund of the Treasury to the DI Trust Fund. After 2007 such transfers are estimated to be less than $\$ 500,000$ in each year.
b The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year. ${ }^{\text {c }}$ Under the high-cost assumptions, the DI Trust Fund is projected to be exhausted in 2016. Therefore, certain trust fund operation values for 2016 to 2018 are not meaningful under present law and are not shown in this table.

Note: Totals do not necessarily equal the sums of rounded components.

Table VI.C6.-Operations of the Combined OASI and DI Trust Funds in Fiscal Years 2004-18
[Dollar amounts in billions]

a "Total Income" column includes transfers made between the OASI and DI Trust Funds and the General Fund of the Treasury that are not included in the separate components of income shown. These transfers consist of payments for (1) the cost of noncontributory wage credits for military service before 1957, and (2) the cost of benefits to certain uninsured persons who attained age 72 before 1968.
${ }^{\text {b }}$ The "Trust fund ratio" column represents assets at the beginning of a year (which are identical to assets at the end of the prior year shown in the "Amount at end of year" column) as a percentage of cost for the year.
Note: Totals do not necessarily equal the sums of rounded components.

## Appendices

## D. LONG-RANGE SENSITIVITY ANALYSIS

This appendix presents estimates that illustrate the sensitivity of the longrange actuarial status of the OASDI program to changes in selected individual assumptions. The estimates, based on the three alternative sets of assumptions (see sections IV.B, V.A, V.B, and V.C), illustrate the effects of varying all of the principal assumptions simultaneously in order to portray a generally more optimistic or pessimistic future, in terms of the financial status of the OASDI program. In the sensitivity analysis presented in this appendix, the intermediate alternative II projection is used as the reference point, and one assumption at a time is varied within that alternative. The variation used for each individual assumption reflects the levels used for that assumption in the low-cost alternative I and high-cost alternative III projections.

Each table in this section shows the effects of changing a particular assumption on the OASDI summarized income rates, summarized cost rates, and actuarial balances for 25 -year, 50 -year, and 75 -year valuation periods. Because the annual payroll tax rate is constant for the entire 75 -year valuation period, the income rate varies only slightly with changes in assumptions and, therefore, is not considered in the discussion of the tables. The change in each of the actuarial balances is approximately equal to the change in the corresponding cost rate, but in the opposite direction.

## 1. Total Fertility Rate

Table VI.D1 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about the ultimate total fertility rate. These assumptions are that the ultimate total fertility rate will be $1.7,2.0$, and 2.3 children per woman as assumed for alternatives III, II, and I, respectively. The rate is assumed to change gradually from its current level and to reach the various ultimate values in 2033.
Table VI.D1.——Sensitivity to Varying Fertility Assumptions
[As a percentage of taxable payroll]
${ }^{\text {a }}$ The total fertility rate for any year is the average number of children who would be born to a woman in her lifetime if she were to experience the birth rates by age observed in, or assumed for, the selected year, and if she were to survive the entire childbearing period. The ultimate total fertility rate is assumed to be reached in 2033.
${ }^{\mathrm{b}}$ Ultimate total fertility rates used for this analysis are 1.7 from the alternative III assumptions, 2.0 from the alternative II assumptions, and 2.3 from the alternative I assumptions. All other assumptions used for this analysis are from alternative II.

For the 25 -year period, the cost rate for the three fertility assumptions varies by only about 0.06 percent of taxable payroll. In contrast, the 75 -year cost rate varies over a wide range, decreasing from 16.41 to 15.66 percent, as the assumed ultimate total fertility rate increases from 1.7 to 2.3. Similarly, while the 25 -year actuarial balance varies by only 0.05 percent of taxable payroll, the 75 -year actuarial balance varies over a much wider range, from -2.35 to -1.68 percent.

During the 25 -year period, the very slight increases in the working population resulting from increases in fertility are more than offset by decreases in the female labor force and increases in the number of child beneficiaries. Hence, the program cost slightly increases with higher fertility. For the 75 -year long-range period, however, changes in fertility have a relatively greater impact on the labor force than on the beneficiary population. As a result, an increase in fertility significantly reduces the cost rate. Each increase of 0.1 in the ultimate total fertility rate increases the long-range actuarial balance by about 0.11 percent of taxable payroll.

## Appendices

## 2. Death Rates

Table VI.D2 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about future reductions in death rates for the period 2008-83. These assumptions are the same as those used for alternatives I, II, and III, which are described in section V.A.2. The age-sex-adjusted death rates decline at average annual rates of 0.33 percent, 0.79 percent, and 1.32 percent for alternatives I, II, and III, respectively.

Table VI.D2.-Sensitivity to Varying Death-Rate Assumptions
[As a percentage of taxable payroll]

| Valuation period | Average annual death-rate reduction ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 0.33 percent | 0.79 percent | 1.32 percent |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 14.97 | 14.96 | 14.96 |
| 50-year: 2009-58 | 14.22 | 14.24 | 14.25 |
| 75-year: 2009-83 | 13.99 | 14.02 | 14.04 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 14.95 | 15.14 | 15.34 |
| 50-year: 2009-58 | 15.27 | 15.75 | 16.27 |
| 75-year: 2009-83 | 15.34 | 16.02 | 16.75 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | +. 02 | -. 17 | -. 38 |
| 50-year: 2009-58 | -1.05 | -1.51 | -2.01 |
| 75-year: 2009-83 | -1.34 | -2.00 | -2.71 |
| Annual balance for 2083 | -2.80 | -4.34 | -5.88 |
| Year of combined trust fund exhaustion | 2039 | 2037 | 2035 |

${ }^{\text {a }}$ The average annual death-rate reduction is the average annual geometric rate of decline in the age-sex adjusted death rate between 2008 and 2083. The overall decreases from the age-sex-adjusted death rate in 2008 to the corresponding rate in 2083 are 22 percent, 45 percent, and 63 percent for alternatives I, II, and III, respectively.
${ }^{\mathrm{b}}$ The average annual death-rate reductions used for this analysis are 0.33 percent from the alternative I assumptions, 0.79 percent from the alternative II assumptions, and 1.32 percent from the alternative III assumptions. All other assumptions used for this analysis are from alternative II.

The variation in cost for the 25 -year period is less pronounced than the variation for the 75 -year period because the decreases in death rates are assumed to occur gradually. The 25 -year cost rate increases from 14.95 percent (for an average annual death-rate reduction of 0.33 percent) to 15.34 percent (for an average annual death-rate reduction of 1.32 percent). The 75 -year cost rate increases from 15.34 to 16.75 percent. The actuarial balance decreases from +0.02 to -0.38 percent for the 25 -year period, and from -1.34 to -2.71 percent for the 75 -year period.

Lower death rates cause both the income (through increased taxable payroll) and the cost of the OASDI program to be higher. The relative increase in
cost, however, exceeds the relative increase in taxable payroll. For any given year, reductions in the death rates for people who are age 62 and over (ages at which death rates are the highest) increase the number of retired-worker beneficiaries (and, therefore, the amount of retirement benefits paid) without adding significantly to the number of covered workers (and, therefore, to the taxable payroll). Although reductions for people at ages 50 to retirement eligibility age do result in significant increases to the taxable payroll, those increases are not large enough to offset the sum of the additional retirement benefits mentioned above and the disability benefits paid to additional beneficiaries at these pre-retirement ages, which are ages of high disability incidence. At ages under 50, death rates are so low that even substantial reductions would not result in significant increases in the numbers of covered workers or beneficiaries. Consequently, if death rates for all ages are lowered by about the same relative amount, cost increases at a rate greater than the rate of growth in payroll, thereby resulting in higher cost rates and, therefore, lower actuarial balances. Each additional 0.1-percentage-point increase in the average annual rate of decline in the death rate decreases the long-range actuarial balance by about 0.14 percent of taxable payroll.

## 3. Net Immigration

Table VI.D3 shows the estimated OASDI income rates, cost rates, and actuarial balances, under alternative II with various assumptions about the magnitude of net immigration. These assumptions are that the annual net immigration will average, over the long-range period, 785,000 persons, 1,065,000 persons, and 1,370,000 persons as assumed for alternatives III, II, and I, respectively.

## Appendices

Table VI.D3.-Sensitivity to Varying Net-Immigration Assumptions
[As a percentage of taxable payroll]

| Valuation period | Average annual net immigration ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 785,000 | 1,065,000 | 1,370,000 |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 15.00 | 14.96 | 14.93 |
| 50-year: 2009-58 | 14.27 | 14.24 | 14.20 |
| 75-year: 2009-83 | 14.06 | 14.02 | 13.98 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 15.22 | 15.14 | 15.04 |
| 50-year: 2009-58 | 15.91 | 15.75 | 15.57 |
| 75-year: 2009-83 | 16.25 | 16.02 | 15.79 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | -. 22 | -. 17 | -. 12 |
| 50-year: 2009-58 | -1.64 | -1.51 | -1.38 |
| 75-year: 2009-83 | -2.19 | -2.00 | -1.81 |
| Annual balance for 2083 | -4.91 | -4.34 | -3.81 |
| Year of combined trust fund exhaustion | 2036 | 2037 | 2037 |

${ }^{\text {a }}$ Net immigration per year is the assumed annual net immigration to the Social Security area, including both legal and other immigration, averaged over the 75-year projection period.
${ }^{\mathrm{b}}$ The average annual net immigration assumptions used for this analysis are 785,000 from the alternative III assumptions, $1,065,000$ from the alternative II assumptions, and $1,370,000$ from the alternative I assumptions. All other assumptions used for this analysis are from alternative II.

For all three periods, the cost rate decreases with increasing rates of net immigration. For the 25 -year period, the cost rate decreases from 15.22 percent of taxable payroll (for average annual net immigration of 785,000 persons) to 15.04 percent (for average annual net immigration of $1,370,000$ persons). For the 50 -year period, it decreases from 15.91 percent to 15.57 percent, and for the 75 -year period, it decreases from 16.25 percent to 15.79 percent. The actuarial balance increases from -0.22 to -0.12 percent for the 25 -year period, from -1.64 to -1.38 percent for the 50 -year period, and from - 2.19 to -1.81 percent for the 75 -year period.
The cost rate decreases with an increase in net immigration because immigration occurs at relatively young ages, thereby increasing the numbers of covered workers earlier than the numbers of beneficiaries. Increasing average annual net immigration by 100,000 persons improves the long-range actuarial balance by about 0.07 percent of taxable payroll.

## 4. Real-Wage Differential

Table VI.D4 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about the real-wage differential. These assumptions are that the ultimate real-wage differential will be 0.5 percentage point, 1.1 percentage points, and 1.7 percentage points as assumed for alternatives III, II, and I, respectively. In each
case, the ultimate annual increase in the CPI is assumed to be 2.8 percent (as assumed for alternative II), yielding ultimate percentage increases in average annual wages in covered employment of 3.3, 3.9, and 4.5 percent.

For the 25 -year period, the cost rate decreases from 15.75 percent (for a realwage differential of 0.5 percentage point) to 14.54 percent (for a differential of 1.7 percentage points). For the 50 -year period, it decreases from 16.66 to 14.86 percent, and for the 75 -year period it decreases from 17.02 to 15.03 percent. The actuarial balance increases from -0.64 to +0.29 percent for the 25 -year period, from -2.25 to -0.79 percent for the 50 -year period, and from -2.81 to -1.20 percent for the 75 -year period.

Table VI.D4.-Sensitivity to Varying Real-Wage Assumptions

| Valuation period | Ultimate percentage increase in wages-CPI ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 3.3-2.8 | 3.9-2.8 | 4.5-2.8 |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 15.10 | 14.96 | 14.83 |
| 50-year: 2009-58 | 14.41 | 14.24 | 14.07 |
| 75-year: 2009-83 | 14.21 | 14.02 | 13.83 |

| Year of combined trust fund exhaustion | 2033 | 2037 | 2044 |

${ }^{\text {a }}$ The first value in each pair is the assumed ultimate annual percentage increase in average wages in covered employment. The second value is the assumed ultimate annual percentage increase in the Consumer Price Index. The difference between the two values is the ultimate real-wage differential.
${ }^{\mathrm{b}}$ The ultimate real-wage differentials of $0.5,1.1$, and 1.7 percentage points are the same as in alternatives III, II, and I, respectively. All other assumptions used for this analysis are from alternative II.

The cost rate decreases with increasing real-wage differentials. This is because higher wages increase taxable payroll immediately, but increase benefit levels only gradually as new beneficiaries become entitled. In addition, cost-of-living adjustments (COLAs) to benefits are not affected by changes in wages, but only in prices. Each 0.5 -percentage-point increase in the assumed real-wage differential increases the long-range actuarial balance by about 0.67 percent of taxable payroll.

## Appendices

## 5. Consumer Price Index

Table VI.D5 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about the rate of increase for the Consumer Price Index (CPI). These assumptions are that the ultimate annual increase in the CPI will be 1.8 percent, 2.8 percent, and 3.8 percent as assumed for alternatives I, II, and III, respectively. In each case, the ultimate real-wage differential is assumed to be 1.1 percentage points (as assumed for alternative II), yielding ultimate percentage increases in average annual wages in covered employment of 2.9 , 3.9 , and 4.9 percent.

Table VI.D5.-Sensitivity to Varying CPI-Increase Assumptions
[As a percentage of taxable payroll]

| Valuation period | Ultimate percentage increase in wages-CPI ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 2.9-1.8 | 3.9-2.8 | 4.9-3.8 |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 15.01 | 14.96 | 14.92 |
| 50-year: 2009-58 | 14.27 | 14.24 | 14.20 |
| 75-year: 2009-83 | 14.05 | 14.02 | 13.99 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 15.31 | 15.14 | 14.97 |
| 50-year: 2009-58 | 15.97 | 15.75 | 15.53 |
| 75-year: 2009-83 | 16.26 | 16.02 | 15.78 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | -. 30 | -. 17 | -. 05 |
| 50-year: 2009-58 | -1.70 | -1.51 | -1.33 |
| 75-year: 2009-83 | -2.21 | -2.00 | -1.80 |
| Annual balance for 2083 | -4.64 | -4.34 | -4.05 |
| Year of combined trust fund exhaustion | 2036 | 2037 | 2038 |

${ }^{\mathrm{a}}$ The first value in each pair is the assumed ultimate annual percentage increase in average wages in covered employment. The second value is the assumed ultimate annual percentage increase in the Consumer Price Index. The difference between the two values is the ultimate real-wage differential.
${ }^{\mathrm{b}}$ The ultimate CPI increases of $1.8,2.8$, and 3.8 percent are the same as in alternatives I, II, and III, respectively. The ultimate real-wage differential of 1.1 percentage points is the same as in alternative II. All other assumptions used for this analysis are also from alternative II.

For all three periods, the cost rate decreases with greater assumed rates of increase in the CPI. For the 25 -year period, the cost rate decreases from 15.31 (for CPI increases of 1.8 percent) to 14.97 percent (for CPI increases of 3.8 percent). For the 50 -year period, it decreases from 15.97 to 15.53 percent, and for the 75 -year period, it decreases from 16.26 to 15.78 percent. The actuarial balance increases from -0.30 to -0.05 percent for the 25 -year period, from -1.70 to -1.33 percent for the 50 -year period, and from - 2.21 to - 1.80 percent for the 75 -year period.

The patterns described above result primarily from the time lag between the effects of the CPI changes on taxable payroll and on benefit payments. When assuming a greater rate of increase in the CPI (in combination with a constant real-wage differential), the effect on taxable payroll due to a greater rate of increase in average wages is experienced immediately, while the effect on benefits due to a larger COLA is experienced with a lag of about 1 year. Thus, the higher taxable payrolls have a stronger effect than the higher benefits, thereby resulting in lower cost rates. The effect of each 1.0 -percentagepoint increase in the rate of change assumed for the CPI is an increase in the long-range actuarial balance of about 0.21 percent of taxable payroll.

## 6. Real Interest Rate

Table VI.D6 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about the annual real interest rate for special public-debt obligations issuable to the trust funds, which are compounded semiannually. These assumptions are that the ultimate annual real interest rate will be 2.1 percent, 2.9 percent, and 3.6 percent as assumed for alternatives III, II, and I, respectively. In each case, the ultimate annual increase in the CPI is assumed to be 2.8 percent (as assumed for alternative II), resulting in ultimate annual yields of 5.0, 5.8, and 6.5 percent.

Table VI.D6.-Sensitivity to Varying Real-Interest Assumptions
[As a percentage of taxable payroll]

| Valuation period | Ultimate annual real interest rate ${ }^{\text {a b }}$ |  |  |
| :---: | :---: | :---: | :---: |
|  | 2.1 percent | 2.9 percent | 3.6 percent |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 14.85 | 14.96 | 15.06 |
| 50-year: 2009-58 | 14.10 | 14.24 | 14.36 |
| 75-year: 2009-83 | 13.86 | 14.02 | 14.16 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 15.28 | 15.14 | 15.02 |
| 50-year: 2009-58 | 15.95 | 15.75 | 15.58 |
| 75-year: 2009-83 | 16.27 | 16.02 | 15.80 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | -. 42 | -. 17 | +. 05 |
| 50-year: 2009-58 | -1.85 | -1.51 | -1.21 |
| 75-year: 2009-83 | -2.41 | -2.00 | -1.64 |
| Annual balance for 2083 | -4.34 | -4.34 | -4.34 |
| Year of combined trust fund exhaustion | 2035 | 2037 | 2039 |

${ }^{\text {a }}$ The ultimate real interest rate is defined to be the effective annual yield on assets held by the trust funds divided by the annual rate of growth in the CPI.
${ }^{\mathrm{b}}$ The ultimate annual real interest rates used for this analysis are 2.1 percent from the alternative III assumptions, 2.9 percent from the alternative II assumptions, and 3.6 percent from the alternative I assumptions. All other assumptions used for this analysis are from alternative II.

## Appendices

For the 25 -year period, the cost rate decreases with increasing real interest rates, from 15.28 percent (for an ultimate real interest rate of 2.1 percent) to 15.02 percent (for an ultimate real interest rate of 3.6 percent). For the 50year period, it decreases from 15.95 to 15.58 percent, and for the 75 -year period, it decreases from 16.27 to 15.80 percent. The actuarial balance increases from -0.42 to +0.05 percent for the 25 -year period, from -1.85 to -1.21 percent for the 50 -year period, and from -2.41 to -1.64 percent for the 75 -year period. Each 0.5 -percentage-point increase in the assumed real interest rate increases the long-range actuarial balance by about 0.26 percent of taxable payroll.

## 7. Disability Incidence Rates

Table VI.D7 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions concerning future disability incidence rates. For all three alternatives, incidence rates by age and sex are assumed to vary during the early years of the projection period before attaining ultimate levels in 2028. In comparison to the historical period 1970 through 2008, the ultimate age-sex-adjusted incidence rate is 2 percent higher for alternative II, 19 percent lower for alternative I, and 21 percent higher for alternative III.

Table VI.D7.—Sensitivity to Varying Disability Incidence Assumptions [As a percentage of taxable payroll]

| Valuation period | Disability incidence rates based on alternative- |  |  |
| :---: | :---: | :---: | :---: |
|  | I | II | III |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 14.96 | 14.96 | 14.97 |
| 50-year: 2009-58 | 14.23 | 14.24 | 14.24 |
| 75-year: 2009-83 | 14.01 | 14.02 | 14.02 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 14.96 | 15.14 | 15.31 |
| 50-year: 2009-58 | 15.50 | 15.75 | 15.99 |
| 75-year: 2009-83 | 15.74 | 16.02 | 16.29 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | ${ }^{\text {a }}$ | -. 17 | -. 34 |
| 50-year: 2009-58 | -1.27 | -1.51 | -1.75 |
| 75-year: 2009-83 . . . . . . . . . . . . . . . . . . . . . . . . . . . . | -1.73 | -2.00 | -2.26 |
| Annual balance for 2083 | -3.98 | -4.34 | -4.68 |
| Year of combined trust fund exhaustion . . . . . . . . . . . . | 2038 | 2037 | 2035 |

${ }^{\text {a }}$ Between -0.005 and 0.005 percent of taxable payroll.

For the 25-year period, the cost rate increases with increasing disability incidence rates, from 14.96 percent (for the relatively low rates assumed for alternative I) to 15.31 percent (for the relatively high rates assumed for alternative III). For the 50 -year period, it increases from 15.50 to 15.99 percent, and for the 75 -year period, it increases from 15.74 to 16.29 percent. The actuarial balance decreases from 0.00 to -0.34 percent for the 25 -year period, from -1.27 to -1.75 percent for the 50 -year period, and from -1.73 to -2.26 percent for the 75 -year period.

## 8. Disability Termination Rates

Table VI.D8 shows the estimated OASDI income rates, cost rates, and actuarial balances, on the basis of alternative II with various assumptions about future disability termination rates. For all three alternatives, death rates are assumed to decline throughout the long-range period. For alternative II, the age-sex-adjusted ${ }^{1}$ death rate is assumed to decline to a level in 2085 that is about 59 percent lower than the level in 2008. For alternative I, the age-sexadjusted death rate is assumed to decline to a level in 2085 that is about 27 percent lower than the level in 2008. For alternative III, the age-sex-adjusted death rate is assumed to decline to a level in 2085 that is about 74 percent lower than the level in 2008.

For all three alternatives, ultimate recovery-termination rates by age, sex, and duration are assumed to be attained in the twentieth year of the projection period. For alternative II, the age-sex-adjusted ${ }^{1}$ recovery rate in 2028 is about 11 recoveries per thousand disabled-worker beneficiaries. For alternative I, the age-sex-adjusted recovery rate in 2028 is about 13 recoveries per thousand disabled-worker beneficiaries. For alternative III, the age-sexadjusted recovery rate in 2028 is about 9 recoveries per thousand disabledworker beneficiaries.

[^18]
## Appendices

| Valuation period | Disability termination rates based on alternative- |  |  |
| :---: | :---: | :---: | :---: |
|  | I | II | III |
| Summarized income rate: |  |  |  |
| 25-year: 2009-33 | 14.96 | 14.96 | 14.97 |
| 50-year: 2009-58 | 14.23 | 14.24 | 14.24 |
| 75-year: 2009-83 | 14.02 | 14.02 | 14.02 |
| Summarized cost rate: |  |  |  |
| 25-year: 2009-33 | 15.09 | 15.14 | 15.18 |
| 50-year: 2009-58 | 15.69 | 15.75 | 15.80 |
| 75-year: 2009-83 | 15.95 | 16.02 | 16.07 |
| Actuarial balance: |  |  |  |
| 25-year: 2009-33 | -. 13 | -. 17 | -. 21 |
| 50-year: 2009-58 | -1.45 | -1.51 | -1.56 |
| 75-year: 2009-83 . . . . . . . . . . . . . . . . . . . . . . . . . . . . | -1.93 | -2.00 | -2.05 |
| Annual balance for 2083 | -4.24 | -4.34 | -4.40 |
| Year of combined trust fund exhaustion . . . . . . . . . . . . | 2037 | 2037 | 2036 |

For the 25 -year period, the cost rate increases with decreasing disability termination rates, from 15.09 percent (for the relatively high termination rates assumed for alternative I) to 15.18 percent (for the relatively low termination rates assumed for alternative III). For the 50 -year period, it increases from 15.69 to 15.80 percent, and for the 75 -year period, it increases from 15.95 to 16.07 percent. The actuarial balance decreases from -0.13 to -0.21 percent for the 25 -year period, from -1.45 to -1.56 percent for the 50 -year period, and from -1.93 to -2.05 percent for the 75 -year period.

## E. STOCHASTIC PROJECTIONS

Significant uncertainty surrounds the estimates under the intermediate assumptions, especially for a period as long as 75 years. This appendix presents a way to illustrate the uncertainty of these estimates. It is intended to supplement the traditional methods of examining such uncertainty and to illustrate the potential value of new techniques.

## 1. Background

The Trustees Report has traditionally shown additional estimates using the low-cost and high-cost sets of specified assumptions to reflect the presence of uncertainty. These additional estimates provide a range of possible outcomes for the projections. However, they provide no indication of the probability that actual future experience will be inside or outside the range of these estimates. This appendix presents the results of a model, based on stochastic modeling techniques, that estimates a probability distribution of future outcomes of the financial status of the combined OASI and DI Trust Funds.

It should be noted that this model is subject to further development. Future improvements and refinements are expected to be more likely to expand, rather than reduce, the indicated range of uncertainty.

## 2. Methodology

Other sections of this report provide estimates of the financial status of the combined OASI and DI Trust Funds using a "deterministic" model. For the deterministic model, certain assumptions are made regarding levels of fertility, changes in mortality, legal and other immigration levels, legal and other emigration levels, changes in the Consumer Price Index, changes in average real wages, unemployment rates, trust fund real yield rates, and disability incidence and recovery rates. In general, each of these variables is assumed to reach an ultimate value at a specific point during the long-range period and to maintain that value throughout the remainder of the period. As mentioned above, three deterministic scenarios are developed assuming separate, specified values for each of these variables. More details about each of these assumptions can be found in section V.

In contrast, the results of 5,000 independent stochastic simulations are presented in this appendix. Each of the 5,000 simulations is determined by allowing the above variables to vary throughout the long-range period. The fluctuation in each variable is projected by using standard time-series modeling, a method designed to help make inferences based on historical data. Generally, each variable is modeled by an equation that captures a relationship between current and prior years’ values of the variable and introduces

## Appendices

year-by-year random variation, as reflected in the historical period. For some variables, the equations additionally reflect relationships with other variables. Parameters for the equations are estimated using historical data for periods between 20 years and 110 years depending on the nature and quality of data available. Each time-series equation is designed such that, in the absence of random variation, the value of the variable would equal the value assumed under the intermediate set of assumptions. More detail on this model, and stochastic modeling in general, is available on the Social Security website. ${ }^{1}$

For each simulation of the model, values for most of the variables listed above are determined by using Monte Carlo techniques to randomly assign the year-by-year variations. The one exception is that net other immigration is modeled rather than individually modeling other immigration and other emigration. Each simulation produces an estimate of the financial status of the combined OASI and DI Trust Funds. Results shown in this appendix reflect the distribution of results from 5,000 model simulations.

The results from this model should be interpreted with caution and with a full understanding of the inherent limitations. Results are very sensitive to equation specifications, degrees of interdependence among variables, and the historical periods used for the estimates. For some variables, using the variations exhibited in a relatively recent historical period may not provide a realistic representation of the potential variation for the future. In addition, results would differ if random variations had been applied to additional variables other than those mentioned above (such as labor force participation rates, retirement rates, marriage rates, and divorce rates). Furthermore, additional variability could result from incorporating statistical approaches that would more fully model change in the long-range central tendencies of the variables. The historical period available for most variables is relatively homogeneous and does not reflect many substantial shifts. The time-series modeling reflects what occurred in the historical period. As a result, the variation indicated in this appendix should be viewed as the minimum plausible variation for the future. Substantial shifts, as predicted by many experts and as seen in prior centuries, are not fully reflected in the current model.

[^19]
## 3. Results

Simulated probability distributions of the annual trust fund ratios for the combined OASI and DI Trust Funds are shown in figure VI.E1. The two extreme lines in this figure illustrate the range within which future annual trust fund ratios are estimated to occur 95 percent of the time (i.e., a 95-percent confidence interval). In other words, actual future trust fund ratios in a given year would be expected to exceed the upper bound only 2.5 percent of the time or to fall below the lower bound 2.5 percent of the time. Other lines in the figure display additional confidence intervals (80-percent, 60-percent, 40 -percent, and 20 -percent) around future annual trust fund ratios. The median estimate for each year indicates the trust fund ratio that is projected by this model to fall exactly in the middle of possible outcomes for that year. It is important to note that these lines do not represent the results of individual stochastic simulations. Instead, for each given year, they represent the percentile distribution of trust fund ratios based on all stochastic simulations for that year.

The median estimate for each year indicates that the assets of the combined OASI and DI Trust Funds would be exhausted by the end of 2036 with a probability of 50 percent. This exhaustion date is 1 year earlier than the year of exhaustion projected under the intermediate assumptions. Figure VI.E1 shows that the 95-percent confidence interval for the trust fund ratio in 2025 ranges from 345 to 127 percent of annual cost. In comparison, the 2025 trust fund ratios for the low-cost and high-cost alternatives are each outside this range, at 385 and 108 percent, respectively. By 2083, the range represented by the low-cost and high-cost projections increases substantially beyond the boundaries of the 95-percent stochastic confidence interval, as seen from the values for the open group unfunded obligation in table VI.E1. This increased variation of the alternatives relative to the stochastic confidence interval is also seen in the positive trust fund ratio for the low-cost scenario for 2083.

## Appendices

Figure VI.E1.—Annual Trust Fund Ratios

The probability distribution of the year-by-year OASDI cost rates (i.e., cost as a percentage of taxable payroll) is shown in figure VI.E2. The range of the cost rates widens as the projections move further into the future, reflecting increasing uncertainty. The income rate under the intermediate assumptions is also included in the figure in order to give some indication of the patterns of cash flow for the OASDI program. Only this income rate is included because of the relatively small variation in income rates throughout the projection period. The lines in figure VI.E2 display the median set (50th percentile) of estimated annual cost rates and the 95-percent, 80-percent, 60 -percent, 40 -percent, and 20-percent confidence intervals expected for future annual cost rates. It is important to note that these lines do not represent the results of individual stochastic simulations. Instead, for each given year, they represent the percentile distribution of cost rates based on all stochastic simulations for that year. The projected cost rates for the year 2035 for the low-cost and high-cost alternatives described earlier are 14.60 percent of payroll and 20.06 percent of payroll, respectively. These are close to the limits of the 95 -percent confidence interval ( 14.85 and 19.93 percent of payroll), as can be seen in figure VI.E2. By 2083, the cost rates for these alternatives, 12.48 and 25.70 percent of payroll, are still close to the limits of the 95-percent confidence interval (13.29 and 25.05 percent of payroll).

## Figure VI.E2.-Annual Cost Rates

Table VI.E1 displays long-range actuarial estimates that illustrate uncertainty for the combined OASDI program using both the deterministic and stochastic approaches. Actuarial estimates included in the table are for the longrange period, 2009-83. Stochastic estimates are shown for the median (50th percentile) and for the 95 -percent and 80 -percent confidence intervals. For comparison, deterministic estimates are shown for the intermediate, lowcost, and high-cost assumptions. Each individual stochastic estimate displayed in the table represents the level at that percentile from the distribution of the 5,000 simulations. However, for each given percentile, the stochastic estimates shown for the different long-range actuarial measures are generally not from the same stochastic simulation.

Median stochastic estimates for the actuarial measures displayed in table VI.E1 are slightly more pessimistic for the combined OASI and DI Trust Funds than the deterministic estimates projected under the intermediate assumptions. The median estimate of the long-range actuarial balance is -2.16 percent of taxable payroll, about 0.16 percentage point lower than projected under the intermediate assumptions. The median estimate for the first year cost exceeds tax income is 2014. This is 2 years earlier than projected under the intermediate assumptions. The median estimate for the year assets first become exhausted is 2036. This is 1 year earlier than the year projected under the intermediate assumptions. The median estimate for the annual cost in the 75th year of the projection period is 17.93 as a percentage of taxable

## Appendices

payroll and 5.90 as a percentage of GDP. The comparable estimates using the intermediate assumptions are 17.68 percent of payroll and 5.86 percent of GDP.

The 95-percent confidence interval determined by the stochastic modeling projections can be compared to the range of variation defined by the traditional low-cost and high-cost alternatives. For four of the measures in table VI.E1 (the actuarial balance, the open group unfunded obligation, the first year assets become exhausted, and the annual cost in the 75th year of the projection period expressed as a percentage of payroll), the 95-percent stochastic projection range is narrower than the range defined by the low-cost and high-cost alternatives. That is, for these measures, the estimates under the low-cost and high-cost alternatives fall outside the 95-percent confidence interval determined by the stochastic modeling projections. In contrast, for one of the measures in the table (the annual cost in the 75th year of the projection period expressed as a percentage of GDP), the 95-percent stochastic projection range includes the estimates under the low-cost and high-cost alternatives. For the remaining measure in the table (the first year cost exceeds tax income), the 95-percent stochastic projection range includes the estimate under the high-cost alternative, but does not include the low-cost estimate.

Table VI.E1.-Long-Range Estimates Relating to the Actuarial Status of the Combined OASDI Program
[Comparison of deterministic and stochastic results]

|  | Traditional deterministic model |  |  | Stochastic model |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | Intermediate | LowCost | HighCost | $\begin{array}{r} \text { Median } \\ 50 \text { th } \\ \text { percentile } \end{array}$ | 80-percent confidence interval |  | 95-percent confidence interval |  |
|  |  |  |  |  | $\begin{array}{r} \text { 10th } \\ \text { percentile } \\ \hline \end{array}$ | 90th percentile | 2.5th percentile | 97.5th percentile |
| Actuarial balance | -2.00 | 0.50 | -5.32 | -2.16 | -3.32 | -1.07 | -3.98 | -0.53 |
| Open group unfunded obligation (in trillions) | \$5.3 | -\$1.8 | \$14.5 | \$5.7 | \$9.3 | \$2.7 | \$11.5 | \$1.2 |
| First year cost exceeds tax income. | 2016 | 2020 | 2013 | 2014 | 2010 | 2017 | 2009 | 2019 |
| First year assets become exhausted ${ }^{\mathrm{a}}$. | 2037 | b | 2029 | 2036 | 2032 | 2043 | 2030 | 2052 |
| Annual cost in 75th year (percent of taxable payroll) | 17.68 | 12.48 | 25.70 | 17.93 | 14.64 | 22.30 | 13.29 | 25.05 |
| Annual cost in 75th year (percent of GDP). . . . . | 5.86 | 4.48 | 7.84 | 5.90 | 4.71 | 7.46 | 4.19 | 8.42 |

${ }^{\text {a }}$ For some stochastic simulations, the first year in which trust fund assets become exhausted does not indicate a permanent exhaustion of assets.
${ }^{\mathrm{b}}$ The fund is not estimated to be exhausted within the projection period.

## F. ESTIMATES FOR OASDI AND HI, SEPARATE AND COMBINED

In this appendix, long-range actuarial estimates for the OASDI and Hospital Insurance (HI) programs are presented separately and on a combined basis. These estimates facilitate analysis of the adequacy of the income and assets of these programs relative to their cost under current law. Estimates for the Supplementary Medical Insurance (SMI) program are not included in this appendix because adequate financing is guaranteed in the law, and because the SMI program is not financed through a payroll tax.

The emphasis in this appendix on combined operations, while significant, should not obscure the analysis of the financial status of the individual trust funds, which are legally separate and cannot be commingled. In addition, the factors which determine the costs of the OASI, DI, and HI programs differ substantially.

## 1. Estimates as a Percentage of Taxable Payroll

Comparing and combining cost and income rates for the OASDI and HI programs as percentages of taxable payroll require a note of caution. The taxable payrolls for the HI program are larger than those estimated for the OASDI program because (1) a larger maximum taxable amount was established for the HI program in 1991, with the maximum being eliminated altogether for the HI program in 1994, (2) a larger proportion of Federal, State, and local government employees have their wages covered under the HI program, and (3) the earnings of railroad workers are included directly in the HI taxable payroll but not in the OASDI taxable payroll (railroad contributions for the equivalent of OASDI benefits are accounted for in a net interchange that occurs annually between the OASDI and Railroad Retirement programs). As a result, the HI taxable payroll is about 25 percent larger than the OASDI taxable payroll throughout the long-range period. Nonetheless, combined OASDI and HI rates shown in this section are computed by adding the separately derived rates for the programs. The resulting combined rates may be interpreted as those applicable to the taxable payroll in the amount of the OASDI payroll, with the separate HI rates being additionally applicable to the excess of the HI payroll over the OASDI payroll.
As with the OASI and DI Trust Funds, income to the HI Trust Fund comes primarily from contributions paid by employees, employers, and selfemployed persons. The combined OASDI and HI contribution rate for employees and their employers is often referred to as the FICA tax, because it is authorized by the Federal Insurance Contributions Act. Contribution rates for the OASDI and HI programs are shown in table VI.F1.

${ }^{\text {a }}$ See footnote a under table VI.A1 in the appendix titled "History of OASI and DI Trust Fund Operations" for a description of tax credits allowed against the combined OASDI and HI taxes on net earnings from selfemployment in 1984-89.

Table VI.F2 shows estimated annual income rates and cost rates for the OASDI program, the HI program, and the combined OASDI and HI programs, based on the low-cost, intermediate, and high-cost sets of assumptions (alternatives I, II, and III) described earlier in this report. These annual rates are intended to indicate the cash-flow operation of the programs. Therefore, income rates exclude interest earned on trust fund assets. Table VI.F2 also shows the differences between income rates and cost rates, called balances. Estimates shown for the combined trust funds are theoretical because no authority currently exists for borrowing by or transfers among these trust funds.

Under all three sets of assumptions, the combined OASDI and HI cost rate is projected to rise above current levels, with the sharpest increase occurring during the period 2013-30. For the combined OASDI and HI programs, under the high-cost set of assumptions, annual deficits are projected to occur for each year of the 75 -year projection period. The cost rate is projected to rise to over three times its current level by the end of the projection period. Under the intermediate assumptions, annual deficits occur in 2010, and in years 2013 through the end of the projection period, with the cost rate nearly doubling by 2083. Under the low-cost assumptions, the cost rate is projected to increase by about 16 percent by the end of the period, with annual deficits beginning in 2019.

${ }^{\text {a }}$ The taxable payroll for HI is significantly larger than the taxable payroll for OASDI because the HI taxable maximum amount was eliminated beginning in 1994, and because HI covers all Federal civilian employees, including those hired before 1984, all State and local government employees hired after April 1, 1986, and railroad employees. Combined OASDI and HI rates are computed as the sum of the separately derived rates for each program.
Notes:

1. The income rate excludes interest income and certain transfers from the General Fund of the Treasury.
2. Totals do not necessarily equal the sums of rounded components.

In table VI.F3 values are summarized over the 25-year, 50-year, and 75-year valuation periods (for which beginning fund balances are included in the summarized income rates, and the cost of accumulating an ending fund balance equal to 100 percent of annual cost by the end of the period is included in the summarized cost rates). Estimates shown for the combined trust funds are theoretical because no authority currently exists for borrowing by or transfers among these trust funds.

| 2009-83.... | 14.18 | 19.51 | -5.32 | 3.57 | 13.31 | -9.74 | 17.75 | 32.82 | -15.06 |

${ }^{\text {a }}$ Income rates include beginning trust fund balances and cost rates include the cost of reaching an ending fund target equal to 100 percent of annual cost by the end of the period.
${ }^{\mathrm{b}}$ The taxable payroll for HI is significantly larger than the taxable payroll for OASDI because the HI taxable maximum amount was eliminated beginning 1994, and because HI covers all Federal civilian employees, including those hired before 1984, all State and local government employees hired after April 1, 1986, and railroad employees. Combined OASDI and HI rates are computed as the sum of the separately derived rates for each program.
${ }^{\mathrm{c}}$ Between -0.005 and 0.005 percent of taxable payroll.
Note: Totals do not necessarily equal the sums of rounded components.
Under the high-cost assumptions, the combined OASDI and HI system is projected to experience large actuarial deficits for the 25-year, 50-year, and 75 -year valuation periods. Under the intermediate assumptions, actuarial deficits smaller than those for the high-cost assumptions are projected for all three valuation periods. Under the low-cost assumptions, the combined OASDI and HI system is projected to have a positive actuarial balance for the 25-year valuation period, a negligible balance (between -0.005 and 0.005 percent of taxable payroll) for the 50-year valuation period, and a negative actuarial balance for the 75 -year valuation period.

## Appendices

## 2. Estimates as a Percentage of Gross Domestic Product

This section presents long-range projections of the operations of the combined Old-Age and Survivors Insurance and Disability Insurance (OASI and DI) Trust Funds and of the Hospital Insurance (HI) Trust Fund expressed as a percentage of gross domestic product (GDP). While expressing these fund operations as a percentage of taxable payroll is the most useful approach for assessing the financial status of the programs (see table IV.B1 and section IV.B.1), analyzing them as a percentage of GDP provides an additional perspective on these fund operations in relation to the total value of goods and services produced in the United States.

Table VI.F4 shows estimated income excluding interest, total cost, and the resulting balance of the combined OASI and DI Trust Funds, of the HI Trust Fund, and of the combined OASI, DI, and HI Trust Funds, expressed as percentages of GDP on the basis of each of the three alternative sets of assumptions. The estimated GDP on which these percentages are based is also shown in table VI.F4. For OASDI, income excluding interest consists of pay-roll-tax contributions, proceeds from taxation of benefits, and various reimbursements from the General Fund of the Treasury. Total cost consists of benefit payments, administrative expenses, net transfers from the trust funds to the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. For HI, income excluding interest consists of payroll-tax contributions (including contributions from railroad employment) and proceeds from taxation of OASDI benefits. Total cost consists of outlays (benefits and administrative expenses) for insured beneficiaries. Both the HI income and cost are on an incurred basis.
The OASDI annual balance (income excluding interest, less cost) as a percentage of GDP is projected to be positive on the basis of the low-cost assumptions until 2020. After 2019, deficits increase to a peak in 2032 and decrease thereafter. By 2057, the OASDI balance becomes positive, reaching 0.20 percent of GDP in 2083. The OASDI balance is projected to be positive through 2015 on the basis of the intermediate assumptions and negative thereafter. Annual deficits increase from 2016 through 2035, decrease from 2036 through 2053, and then increase thereafter. On the basis of the highcost assumptions, the OASDI balance is projected to be positive through 2012, after which time balances become permanently negative, with increasing deficits thereafter. The HI balance is projected to be negative in the first projection year under all three sets of assumptions, with deficits generally increasing steadily thereafter, though to different degrees, under each set of assumptions.

The combined OASDI and HI balance as a percentage of GDP is projected to be positive through 2018 under the low-cost assumptions, but negative throughout the projection period under the intermediate and high-cost assumptions. Between 2013 and about 2035, under all three sets of assumptions, the combined OASDI and HI balance as a percentage of GDP is generally projected to decline (or deficits increase) substantially because the babyboom generation reaches retirement eligibility age during these years. After 2035, annual deficits increase fairly steadily under the intermediate and highcost assumptions, but decrease through 2054 and increase thereafter under the low-cost assumptions.

By 2083, the combined OASDI and HI balances as percentages of GDP are projected to range from a deficit of 0.85 percent for the low-cost assumptions to a deficit of 12.03 percent for the high-cost assumptions. Projected balances differ by a much smaller amount for the tenth year, 2018, ranging from a positive balance of 0.06 percent for the low-cost assumptions to a deficit of 1.66 percent for the high-cost assumptions.

The summarized long-range (75-year) balance as a percentage of GDP for the combined OASDI and HI programs varies among the three alternatives, by a relatively large amount (from a deficit of 0.18 percent, based on the low-cost assumptions, to a deficit of 6.11 percent, based on the high-cost assumptions). The 25 -year summarized balance varies by a smaller amount (from a positive balance of 0.34 percent to a deficit of 2.08 percent). Summarized rates are calculated on the present-value basis including the trust fund balances on January 1, 2009, and the cost of reaching a target trust fund level equal to 100 percent of the following year's annual cost at the end of the period. (See section IV.B. 4 for further explanation.)

${ }^{\text {a }}$ Income for individual years excludes interest on the trust funds. Interest is implicitly reflected in all summarized values.
${ }^{\mathrm{b}}$ Summarized rates are calculated on the present-value basis including the value of the trust funds on January 1, 2009, and the cost of reaching a target trust fund level equal to 100 percent of annual cost at the end of the period.

Note: Totals do not necessarily equal the sums of rounded components.
The difference between trust fund operations expressed as percentages of taxable payroll and those expressed as percentages of GDP can be understood by analyzing the estimated ratios of OASDI taxable payroll to GDP, which are presented in table VI.F5. HI taxable payroll is about 25 percent larger than the OASDI taxable payroll throughout the long-range period (see Appendix VI.F. 1 for a detailed description of the difference). The cost as a

## Appendices

percentage of GDP is equal to the cost as a percentage of taxable payroll multiplied by the ratio of taxable payroll to GDP.

Projections of GDP are based on the projected increases in U.S. employment, labor productivity, average hours worked, and the GDP implicit price deflator. Projections of taxable payroll reflect the projected growth in GDP, along with assumed changes in the ratio of worker compensation to GDP, the ratio of earnings to worker compensation, the ratio of OASDI covered earnings to total earnings, and the ratio of taxable to total covered earnings.

Over the long-range period, projected growth in taxable payroll differs from projected growth in GDP primarily due to the assumed trend in the ratio of wages to total employee compensation-i.e., wages plus fringe benefits. The ratio of earnings to total worker compensation declined at an average annual rate of 0.23 percent for the 40 years from 1967 to 2007 . For the 10 -year periods 1967-77, 1977-87, 1987-97, and 1997-2007, the average annual rates of change were $-0.63,-0.19,0.09$ and -0.16 percent, respectively. Ultimate future annual rates of decline in the ratio of wages to employee compensation are assumed to be $0.1,0.2$, and 0.3 percent for the low-cost, intermediate, and high-cost assumptions, respectively. An additional factor that has made the overall ratio of taxable payroll to GDP decline in recent years is the decline in the ratio of taxable wages to covered wages, as a result of the relatively greater increases in wages for persons earning above the contribution and benefit base. This decline in the taxable ratio is assumed to continue at a slower pace through 2018, with no further decline thereafter.

## 3. Estimates in Dollars

This section presents long-range projections in dollars of the operations of the combined OASI and DI Trust Funds and in some cases the HI Trust Fund. Meaningful comparison of current dollar values over long periods of time can be difficult because of the effect of inflation. Some means of removing inflation is thus generally desirable. Several economic series or indices are provided to allow current dollars to be adjusted for changes in prices, wages, and certain other aspects of economic growth during the projection period.

The selection of a particular index for adjustment of current dollars depends upon the analyst's decision as to which index provides the most useful standard for adjusting dollar amounts, over time, to create values that are appropriately comparable. Table VI.F6 presents five such indices for adjustment. Adjustment of any series of values is accomplished by dividing the value for each year by the corresponding index values for the year. This adjustment removes the inflation in the index from the series of values.

One of the most common forms of standardization is based on some measure of change in the prices of consumer goods. One such price index is the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W, hereafter referred to as CPI), which is published by the Bureau of Labor Statistics, Department of Labor. This is the index used to determine annual increases in OASDI monthly benefits payable after the year of initial eligibility. The CPI is assumed to increase ultimately at annual rates of $1.8,2.8$, and 3.8 percent for the low-cost, intermediate, and high-cost sets of assumptions, respectively. Constant-dollar values (those calculated by dividing by the adjusted CPI in table VI.F6) indicate the relative purchasing power of the values over time. Constant-dollar values are provided in table VI.F7.
Another type of standardization combines the effects of price inflation and real-wage growth. The wage index presented here is the national average wage index, as defined in section $215(\mathrm{i})(1)(\mathrm{G})$ of the Social Security Act. This index is used to make annual adjustments to many earnings-related quantities embodied in the Social Security Act, such as the contribution and benefit base. The average annual wage is assumed to increase ultimately by $3.5,3.9$, and 4.3 percent under the low-cost, intermediate, and high-cost assumptions, respectively. Wage-indexed values indicate the level of a series relative to the standard-of-living of workers over time.
The taxable payroll index adjusts for the effects of changes in the number of workers and changes in the proportion of earnings that are taxable, as well as

## Appendices

for the effects of price inflation and real-wage growth. The OASDI taxable payroll consists of all earnings subject to OASDI taxation, adjusted for the lower effective tax rate on multiple-employer excess wages. Values adjusted by dividing by the taxable payroll indicate the percentage of payroll that each value represents, and thus the extent to which the series of values increases or decreases as a percent of payroll over time.

The GDP index adjusts for the growth in the aggregate amount of goods and services produced in the United States. Values adjusted by GDP (see Appendix VI.F.2) indicate their relative share of the total output of the economy. No explicit assumptions are made about growth in taxable payroll or GDP. These series are computed reflecting the other more basic demographic and economic assumptions, as discussed in sections V.A and V.B, respectively.

Discounting at the rate of interest is another way of adjusting current dollars. The series of interest-rate factors included here is based on the average of the assumed annual interest rates for special public-debt obligations issuable to the trust funds for each year. This series is slightly different from the interest rates used to create summarized values elsewhere in this report, where the actual yield on currently-held trust fund assets is used for each year. Ultimate nominal interest rates, which, in practice, are compounded semiannually, are assumed to be approximately $5.4,5.7$, and 5.9 percent for the low-cost, intermediate, and high-cost assumptions, respectively.

${ }^{\text {a }}$ The adjusted CPI is the CPI-W indexed to calendar year 2009.
${ }^{\mathrm{b}}$ The average wage index is used to automatically adjust the contribution and benefit base and other wageindexed program amounts. (See "Average wage index" in the glossary.)
${ }^{\text {c }}$ Taxable payroll consists of total earnings subject to OASDI contribution rates, adjusted to reflect the lower effective contribution rates (compared to the combined employee-employer rate) that apply to multipleemployer "excess wages."
${ }^{\mathrm{d}}$ The compound interest-rate factor is based on the average of the assumed annual interest rates for special public-debt obligations issuable to the trust funds in the 12 months of the year, under each alternative.

Table VI.F7 shows estimated operations of the combined OASI and DI Trust Funds in constant 2009 dollars (i.e., adjusted by the CPI indexing series as discussed above). Items included in the table are: income excluding interest, interest income, total income, total cost, and assets at the end of the year. Income excluding interest consists of payroll-tax contributions, income from taxation of benefits, and miscellaneous reimbursements from the General Fund of the Treasury. Cost consists of benefit payments, administrative expenses, net transfers from the OASI and DI Trust Funds to the Railroad Retirement program under the financial-interchange provisions, and payments for vocational rehabilitation services for disabled beneficiaries. These estimates are based on the low-cost, intermediate, and high-cost sets of assumptions.

Table VI.F7.-Operations of the Combined OASI and DI Trust Funds,
in Constant 2009 Dollars, ${ }^{\text {a }}$ Calendar Years 2009-85 [In billions]

| 2020. | 802.5 | 127.0 | 929.5 | 987.7 | 2,137.4 |
| 2025 ${ }^{\text {b }}$. . . . . . . | 843.6 | 66.3 | 909.9 | 1,144.5 | 1,006.2 |

${ }^{\text {a }}$ The adjustment from current to constant dollars is by the adjusted CPI indexing series shown in table VI.F6.
${ }^{\text {b }}$ Estimates for later years are not shown because the combined OASI and DI Trust Funds are estimated to become exhausted in 2037 under the intermediate assumptions and in 2029 under the high-cost assumptions. Note: Totals do not necessarily equal the sums of rounded components.

## Appendices

Figure VI.F1 provides a comparison of annual cost with total annual income (including interest) and annual income excluding interest, for the OASDI program under intermediate assumptions. All values are expressed in constant dollars, as shown in table VI.F7. The difference between the income values for each year is equal to the trust fund interest earnings. Thus the figure illustrates the fact that, under intermediate assumptions, combined OASDI cost will be payable from (1) current tax income alone through 2015, (2) current tax income plus amounts from the trust funds that are less than annual interest income for years 2016 through 2023, and (3) current tax income plus amounts from the trust funds that are greater than annual interest income for years 2024 through 2036, i.e., through the year preceding the year of trust fund exhaustion.

Figure VI.F1.-Estimated OASDI Income and Cost in Constant Dollars, Based on Intermediate Assumptions
[In billions]

Table VI.F8 shows estimated operations of the combined OASI and DI Trust Funds in current dollars-that is in dollars unadjusted for price inflation. Items included in the table are: income excluding interest, interest income, total income, total cost, and assets at the end of the year. These estimates, based on the low-cost, intermediate, and high-cost sets of demographic and economic assumptions, are presented to facilitate independent analysis.

Table VI.F8.-Operations of the Combined OASI and DI Trust Funds, in Current Dollars, Calendar Years 2009-85 [In billions]

${ }^{\text {a }}$ Estimates for later years are not shown because the combined OASI and DI Trust Funds are estimated to become exhausted in 2037 under the intermediate assumptions and in 2029 under the high-cost assumptions. Note: Totals do not necessarily equal the sums of rounded components.

## Appendices

Table VI.F9 shows, in current dollars, estimated income (excluding interest) and estimated total cost (excluding the cost of accumulating target trust fund balances) of the combined OASI and DI Trust Funds, of the HI Trust Fund, and of the combined OASI, DI, and HI Trust Funds, based on the low-cost, intermediate, and high-cost sets of assumptions described earlier in this report. For OASDI, income excluding interest consists of payroll-tax contributions, proceeds from taxation of OASDI benefits, and miscellaneous transfers from the General Fund of the Treasury. Cost consists of benefit payments, administrative expenses, net transfers from the trust funds to the Railroad Retirement program, and payments for vocational rehabilitation services for disabled beneficiaries. For HI, income excluding interest consists of payroll-tax contributions (including contributions from railroad employment) and proceeds from the taxation of OASDI benefits. Total cost consists of outlays (scheduled benefits and administrative expenses) for insured beneficiaries. Income and cost estimates are shown on a cash basis for the OASDI program and on an incurred basis for the HI program.

Table VI.F9 also shows the difference between income excluding interest and cost, which is called the balance. The balance indicates the size of the difference between tax income and cost.

Note: Totals do not necessarily equal the sums of rounded components.
Table VI.F10 shows projected future benefit amounts payable upon retirement at either the normal retirement age (NRA) or age 65 , for workers attaining age 65 in 2009 and subsequent years. Illustrative benefit levels are shown for workers with four separate pre-retirement earnings patterns. All estimates are based on the intermediate assumptions in this report. The benefit amounts are shown in constant 2009 dollars (adjusted to 2009 levels by the CPI indexing series shown in table VI.F6). Benefit amounts are also shown as percentages of the career-average relative earnings level for each case, wage indexed to the year prior to retirement. These percentages thus represent the benefit "replacement rate" of the career-average level of earnings.
The normal retirement age was 65 for individuals who reached age 62 before 2000 , was then increased to age 66 during the period 2000-05 (at a rate of 2 months per year as workers attained age 62), and is scheduled to increase to age 67 during the period 2017-22 (also by 2 months per year as workers attain age 62). Thus, for the illustrative cases shown in table VI.F10, benefit levels shown for retirement at 65 are lower than the levels shown for retire-
ment at NRA, primarily because of the actuarial reduction for "early" (preNRA) retirement.

Four different pre-retirement earnings patterns are represented in table VI.F10. Three of these cases are for workers with scaled-earnings patterns, ${ }^{1}$ reflecting low, medium, and high career-average levels of pre-retirement earnings starting at age 21 . The fourth case is the steady maximum earner. The three scaled-earnings cases have earnings patterns that reflect differences by age in the probability of work and in average earnings levels experienced by insured workers during the period 1991-2005. The general, careeraverage level of earnings for the scaled cases is set relative to the national average wage index (AWI) so that benefit levels are consistent with levels for "steady-earnings" cases that were shown in the 2000 and earlier Trustees Reports. For the scaled medium earner, the general, career-average earnings level is about equal to the AWI. For the scaled low and high earners, the general, career-average earnings level is set at about 45 percent and 160 percent of the AWI, respectively. The steady maximum earner is assumed to have earnings at (or above) the contribution and benefit base for each year prior to retirement starting at age 22.
As noted above, the scaled-earnings cases were constructed so that their career-average earnings levels are consistent with those of the corresponding steady low, average, and high earners that were illustrated in the 2000 and earlier Trustees Reports. As a result, values in this table for benefits under the present-law Social Security benefit formula are essentially comparable to those in earlier reports. Scaled-earnings cases are now being used instead of steady-earnings cases because they more accurately illustrate the differences in benefit levels under the wide variety of reform proposals considered in recent years.

${ }^{\text {a }}$ Annual scheduled benefit amounts are the total for the 12 -month period starting with the month of retirement.
${ }^{\mathrm{b}}$ Assumed to attain age 65 in January of the year.
${ }^{\text {c }}$ The adjustment for constant dollars is made using the adjusted CPI indexing series shown in table VI.F6.
${ }^{\mathrm{d}}$ Career-average earnings at about 45 percent of the national average wage index (AWI).
${ }^{\mathrm{e}}$ Career-average earnings at about 100 percent of the AWI.
${ }^{\mathrm{f}}$ Career-average earnings at about 160 percent of the AWI.
g Earnings for each year equal to the contribution and benefit base.

## Appendices

## G ANALYSIS OF BENEFIT DISBURSEMENTS FROM THE OASI TRUST FUND WITH RESPECT TO DISABLED BENEFICIARIES (Required by section 201(c) of the Social Security Act)

Effective January 1957, monthly benefits have been payable from the OASI Trust Fund to disabled children aged 18 and over of retired and deceased workers in those cases for which the disability began before age 18. The age before which disability is required to have begun was subsequently changed to age 22. Effective February 1968, reduced monthly benefits have been payable from this trust fund to disabled widows and widowers at ages 50 and over. Effective January 1991, the requirements for the disability of the widow or widower were made less restrictive.

On December 31, 2008, about 922,000 persons were receiving monthly benefits from the OASI Trust Fund because of their disabilities or the disabilities of children. This total includes 26,000 mothers and fathers (wives or husbands under age 65 of retired-worker beneficiaries and widows or widowers of deceased insured workers) who met all other qualifying requirements and were receiving unreduced benefits solely because they had disabled-child beneficiaries (or disabled children aged 16 or 17) in their care. Benefits paid from this trust fund to the persons described above totaled $\$ 7,796$ million in calendar year 2008. Table VI.G1 shows these and similar figures for selected calendar years during 1960-2008, and estimated experience for 2009-18 based on the intermediate set of assumptions.

${ }^{\text {a }}$ Beginning in 1966, includes payments for vocational rehabilitation services.
${ }^{\mathrm{b}}$ Also includes certain mothers and fathers (see text).
${ }^{\text {c }}$ In 1984 and later years, only disabled widows and widowers aged 50-59 are included because disabled widows and widowers aged 60-64 would be eligible for the same benefit as a nondisabled aged widow or widower; therefore, they are not receiving benefits solely because of a disability.
${ }^{\text {d }}$ In 1983 and prior years, reflects the offsetting effect of lower benefits payable to disabled widows and widowers who continued to receive benefits after attaining age 60 ( 62 , for disabled widowers, prior to 1973) as compared to the higher nondisabled widow's and widower's benefits that would otherwise be payable. In 1984 and later years, only benefit payments to disabled widows and widowers aged 50-59 are included (see footnote c).
Note: Totals do not necessarily equal the sums of rounded components.

## Appendices

Total benefit payments from the OASI Trust Fund with respect to disabled beneficiaries are estimated to increase from $\$ 8,439$ million in calendar year 2009 to $\$ 12,335$ million in calendar year 2018, based on the intermediate assumptions.

In calendar year 2008, benefit payments (including expenditures for vocational rehabilitation services) with respect to disabled persons from the OASI Trust Fund and from the DI Trust Fund (including payments from the latter fund to all children and spouses of disabled-worker beneficiaries) totaled $\$ 114,173$ million. Of this amount, $\$ 7,796$ million or 6.8 percent represented payments from the OASI Trust Fund. These and similar figures for selected calendar years during 1960-2008 and estimates for calendar years 2009-18 are presented in table VI.G2.

| 2018. | 189,786 | 177,451 | 12,335 | 6.5 |

${ }^{\text {a }}$ Beginning in 1966, includes payments for vocational rehabilitation services.
${ }^{\mathrm{b}}$ Benefit payments to disabled workers and their children and spouses.
${ }^{\text {c }}$ Benefit payments to disabled children aged 18 and over, to certain mothers and fathers (see text), and to disabled widows and widowers (see footnote ${ }^{\mathrm{d}}$, table VI.G1).
${ }^{d}$ Excludes reimbursement of $\$ 0.7$ billion for excess amounts of voluntary income tax withholding in 19992005.
${ }^{\mathrm{e}}$ Excludes interfund transfers to correct a trust fund allocation error made on payments to certain disabled beneficiaries. These transfers amounted to $\$ 3.3$ billion in 2007 and $\$ 0.3$ billion in 2008 from OASI to DI.
Note: Totals do not necessarily equal the sums of rounded components.

## H. GLOSSARY

Actuarial balance. The difference between the summarized income rate and the summarized cost rate over a given valuation period.
Actuarial deficit. A negative actuarial balance.
Administrative expenses. Expenses incurred by the Social Security Administration and the Department of the Treasury in administering the OASDI program and the provisions of the Internal Revenue Code relating to the collection of contributions. Such administrative expenses are paid from the OASI and DI Trust Funds.
Advance tax transfers. Amounts representing the estimated total OASDI tax contributions for a given month. From May 1983 through November 1990, such amounts were credited to the OASI and DI Trust Funds at the beginning of each month. Reimbursements were made from the trust funds to the General Fund of the Treasury for the associated loss of interest. Advance tax transfers are no longer made unless needed in order to pay benefits.
Alternatives I, II, or III. See "Assumptions."
Annual balance. The difference between the income rate and the cost rate in a given year.
Assets. Treasury notes and bonds, other securities guaranteed by the Federal Government, certain Federally sponsored agency obligations, and cash, held by the trust funds for investment purposes.
Assumptions. Values relating to future trends in certain key factors that affect the balance in the trust funds. Demographic assumptions include fertility, mortality, net immigration, marriage, and divorce. Economic assumptions include unemployment rates, average earnings, inflation, interest rates, and productivity. Program-specific assumptions include retirement patterns, and disability incidence and termination rates. Three sets of demographic, economic, and program-specific assumptions are presented in this report-

- Alternative II is the intermediate set of assumptions, and represents the Trustees' best estimates of likely future demographic, economic, and program-specific conditions.
- Alternative I is characterized as a low-cost set-it assumes relatively rapid economic growth, low inflation, and favorable (from the standpoint of program financing) demographic and program-specific conditions.
- Alternative III is characterized as a high-cost set-it assumes relatively slow economic growth, high inflation, and unfavorable (from the standpoint of program financing) demographic and program-specific conditions.

See tables V.A1, V.B1, and V.B2.

Automatic cost-of-living benefit increase. The annual increase in benefits, effective for December, reflecting the increase in the cost of living. The benefit increase equals the percentage increase in the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W) measured from the average over July, August, and September of the preceding year to the average for the same 3 months in the current year. If the increase is less than onetenth of 1 percent, when rounded, there is no automatic increase for the current year; the increase for the next year would reflect the net increase in the CPI over a 2 -year period. See table V.C1.
Auxiliary benefits. Monthly benefits payable to a spouse or child of a retired or disabled worker, or to a survivor of a deceased worker.
Average indexed monthly earnings-AIME. The amount of earnings used in determining the primary insurance amount (PIA) for most workers who attain age 62, become disabled, or die after 1978. A worker's actual past earnings are adjusted by changes in the average wage index, in order to bring them up to their approximately equivalent value at the time of retirement or other eligibility for benefits.
Average wage index-AWI. The average amount of total wages for each year after 1950, including wages in noncovered employment and wages in covered employment in excess of the OASDI contribution and benefit base. (See Title 20, Chapter III, section 404.211(c) of the Code of Federal Regulations for a more precise definition.) These average wage amounts are used to index the taxable earnings of most workers first becoming eligible for benefits in 1979 or later, and for automatic adjustments in the contribution and benefit base, bend points, earnings test exempt amounts, and other wageindexed amounts. See table V.C1.
Award. An administrative determination that an individual is entitled to receive a specified type of OASDI benefit. Awards can represent not only new entrants to the benefit rolls but also persons already on the rolls who become entitled to a different type of benefit. Awards usually result in the immediate payment of benefits, although payments may be deferred or withheld depending on the individual's particular circumstances.
Baby boom. The period from the end of World War II through the mid1960s marked by unusually high birth rates.
Bend points. The dollar amounts defining the AIME or PIA brackets in the benefit formulas. For the bend points for years 1979 and later, see table V.C2.
Beneficiary. A person who has been awarded benefits on the basis of his or her own or another's earnings record. The benefits may be either in currentpayment status or withheld.
Benefit award. See "Award."

## Appendices

Benefit payments. The amounts disbursed for OASI and DI benefits by the Department of the Treasury in specified periods.
Benefit termination. See "Termination."
Best estimate assumptions. See "Assumptions."
Board of Trustees. A Board established by the Social Security Act to oversee the financial operations of the Federal Old-Age and Survivors Insurance Trust Fund and the Federal Disability Insurance Trust Fund. The Board is composed of six members, four of whom serve automatically by virtue of their positions in the Federal Government: the Secretary of the Treasury, who is the Managing Trustee, the Secretary of Labor, the Secretary of Health and Human Services, and the Commissioner of Social Security. The other two members are appointed by the President to serve as public representatives.
Cash flow. The cash flow for the OASI and DI Trust Funds is defined generally as actual or projected revenue and costs reflecting the levels of tax rates and benefits scheduled in the law. Net cash flow is the difference between tax revenue and cost on this basis.
Closed group unfunded obligation. This measure is computed like the open group unfunded obligation except that individuals under the age of 15 (or not yet born) are excluded. In other words, only persons who attain age 15 or older during the first year of the projection period are included in the calculations.
Constant dollars. Amounts adjusted by the CPI to the value of the dollar in a particular year.
Consumer Price Index-CPI. An official measure of inflation in consumer prices. In this report, all references to the CPI relate to the Consumer Price Index for Urban Wage Earners and Clerical Workers (CPI-W). Historical values for the CPI-W are published by the Bureau of Labor Statistics, Department of Labor.
Contribution and benefit base. Annual dollar amount above which earnings in employment covered under the OASDI program are neither taxable nor creditable for benefit-computation purposes. (Also referred to as maximum contribution and benefit base, annual creditable maximum, taxable maximum, and maximum taxable.) See tables V.C1 and VI.A1. See "HI contribution base."
Contributions. The amount based on a percent of earnings, up to an annual maximum, that must be paid by-

- employers and employees on wages from employment under the Federal Insurance Contributions Act,
- the self-employed on net earnings from self-employment under the Self-Employment Contributions Act, and
- States on the wages of State and local government employees covered under the Social Security Act through voluntary agreements under section 218 of the Act.

Generally, employers withhold contributions from wages, add an equal amount of contributions, and pay both on a current basis. Also referred to as taxes.
Cost. The cost for a year is defined to include scheduled benefit payments, administrative expenses, net transfers from the trust funds to the Railroad Retirement program under the financial-interchange provisions, and payments for vocational rehabilitation services for disabled beneficiaries; it excludes transfers under the interfund borrowing provisions.
Cost-of-living adjustment. See "Automatic cost-of-living benefit increase."
Cost rate. The cost rate for a year is the ratio of the cost of the program to the taxable payroll for the year.
Covered earnings. Earnings in employment covered by the OASDI program.
Covered employment. All employment for which earnings are creditable for Social Security purposes. Almost all employment is covered under the program. Some exceptions are:

- State and local government employees whose employer has not elected to be covered under Social Security and who are participating in an employer-provided pension plan.
- Current Federal civilian workers hired before 1984 who have not elected to be covered.
- Self-employed workers earning less than \$400 in a calendar year.

Covered worker. A person who has earnings creditable for Social Security purposes on the basis of services for wages in covered employment and/or on the basis of income from covered self-employment.
Creditable earnings. Wage or self-employment earnings posted to a worker's earnings record, upon which eligibility for and amount of benefits on that worker's record is based. The maximum amount of creditable earnings for each worker in a calendar year is determined by the contribution and benefit base.
Current-cost financing. See "Pay-as-you-go financing."
Current dollars. Amounts expressed in nominal dollars with no adjustment for inflationary changes in the value of the dollar over time.
Current-payment status. Status of a beneficiary to whom a benefit is being paid for a given month (with or without deductions, provided the deductions add to less than a full month's benefit).
Deemed wage credit. See "Military service wage credits."

## Appendices

Delayed retirement credits. Increases the benefit amount for certain individuals who did not receive benefits for months after attainment of the normal retirement age but before age 70 . Delayed retirement credits are applicable for January benefits of the year following the year they are earned or for the month of attainment of age 70, whichever comes first. See table V.C3.

Demographic assumptions. See "Assumptions."
Deterministic model. A model with specified assumptions for and relationships among variables. Under such a model, any specified set of assumptions determines a single outcome directly reflecting the specifications.
Disability. For Social Security purposes, the inability to engage in substantial gainful activity (see "Substantial gainful activity-SGA") by reason of any medically determinable physical or mental impairment that can be expected to result in death or to last for a continuous period of not less than 12 months. Special rules apply for workers at ages 55 and over whose disability is based on blindness.
The law generally requires that a person be disabled continuously for 5 months before he or she can qualify for a disabled-worker benefit.
Disability conversion ratio. For a given year, the ratio of the number of disability conversions to the average number of disabled-worker beneficiaries during the year.
Disability conversion. Upon attainment of normal retirement age, a dis-abled-worker beneficiary is automatically converted to retired-worker status.
Disability incidence rate. The proportion of workers in a given year, insured for but not receiving disability benefits, who apply for and are awarded disability benefits.
Disability Insurance (DI) Trust Fund. See "Trust fund."
Disability prevalence rate. The proportion of persons insured for disability benefits who are disabled-worker beneficiaries in current-payment status.
Disability termination rate. The proportion of disabled-worker beneficiaries in a given year whose disability benefits terminate as a result of the individual's recovery or death.
Disabled-worker benefit. A monthly benefit payable to a disabled worker under normal retirement age and insured for disability. Before November 1960, disability benefits were limited to disabled workers aged 50-64.
Disbursements. Actual expenditures (outgo) made or expected to be made under current law, including benefits paid or payable, administrative expenses, net transfers from the trust funds to the Railroad Retirement program under the financial-interchange provisions, and payments for vocational rehabilitation services for disabled beneficiaries; it excludes transfers under the interfund borrowing provisions.

Earnings. Unless otherwise qualified, all wages from employment and net earnings from self-employment, whether or not taxable or covered.
Earnings test. The provision requiring the withholding of benefits if beneficiaries under normal retirement age have earnings in excess of certain exempt amounts. See table V.C1.
Economic assumptions. See "Assumptions."
Effective interest rate. See "Interest rate."
Excess wages. Wages in excess of the contribution and benefit base on which a worker initially pays taxes (usually as a result of working for more than one employer during a year). Employee taxes on excess wages are refundable to affected employees, while the employer taxes are not refundable.
Expenditures. See "Disbursements."
Federal Insurance Contributions Act-FICA. Provision authorizing taxes on the wages of employed persons to provide for Retirement, Survivors, and Disability Insurance, and for Hospital Insurance. The tax is paid in equal amounts by workers and their employers.
Financial interchange. Provisions of the Railroad Retirement Act providing for transfers between the trust funds and the Social Security Equivalent Benefit Account of the Railroad Retirement program in order to place each trust fund in the same position it would have been in if railroad employment had always been covered under Social Security.
Fiscal year. The accounting year of the United States Government. Since 1976, a fiscal year is the 12 -month period ending September 30. For example, fiscal year 2009 began October 1, 2008, and will end September 30, 2009.

Full advance funding. A financing scheme where taxes or contributions are established to match the full cost of future benefits as these costs are incurred through current service. Such financing methods also provide for amortization over a fixed period of any financial liability that is incurred at the beginning of the program (or subsequent modification) as a result of granting credit for past service.
General Fund of the Treasury. Funds held by the Treasury of the United States, other than receipts collected for a specific purpose (such as Social Security) and maintained in a separate account for that purpose.
General fund reimbursements. Transfers from the General Fund of the Treasury to the trust funds for specific purposes defined in the law, such as:

- Payments corresponding to the employee-employer taxes on deemed wage credits for military personnel.

## Appendices

- Interest on checks which are not negotiated 6 months after the month of issue. (For checks issued before October, 1989, the principal was returned to the trust funds as a general fund reimbursement; since that time, the principal amount is automatically returned to the issuing fund when the check is uncashed after a year.)
- Administrative expenses incurred as a result of furnishing information on deferred vested benefits to pension plan participants, as required by the Employee Retirement Income Security Act of 1974 (Public Law 93406).

Gross domestic product-GDP. The total dollar value of all goods and services produced by labor and property located in the United States, regardless of who supplies the labor or property.
HI contribution base. Annual dollar amount above which earnings in employment covered under the HI program are not taxable. (Also referred to as maximum contribution base, taxable maximum, and maximum taxable.) Beginning in 1994, the HI contribution base was eliminated.
High-cost assumptions. See "Assumptions."
Hospital Insurance (HI) Trust Fund. See "Trust fund."
Immigration. See "Legal immigration" and "Other immigration."
Income. Income for a given year is the sum of tax revenues on a liability basis (payroll-tax contributions and income from the taxation of scheduled benefits) and interest credited to the trust funds.
Income rate. Ratio of income from tax revenues on a liability basis (payrolltax contributions and income from the taxation of scheduled benefits) to the OASDI taxable payroll for the year.
Inflation. An increase in the volume of money and credit relative to available goods, resulting in an increase in the general price level.
Insured status. The state or condition of having sufficient quarters of coverage to meet the eligibility requirements for retired-worker or disabled-worker benefits, or to permit the worker's spouse and children or survivors to establish eligibility for benefits in the event of his or her disability, retirement, or death. See "Quarters of coverage."
Interest. A payment in exchange for the use of money during a specified period.
Interest rate. Interest rates on new public-debt obligations issuable to Federal trust funds (see "Special public-debt obligation") are determined monthly. Such rates are set equal to the average market yield on all outstanding marketable U.S. securities not due or callable until after 4 years from the date the rate is determined. See table V.B2 for historical and assumed future interest rates on new special-issue securities. The effective interest rate for a trust fund is the ratio of the interest earned by the fund over a given period of
time to the average level of assets held by the fund during the period. The effective rate of interest thus represents a measure of the overall average interest earnings on the fund's portfolio of assets.
Interfund borrowing. The borrowing of assets by a trust fund (OASI, DI, or HI ) from another of the trust funds when the first fund is in danger of exhaustion. Interfund borrowing was permitted by the Social Security Act only during 1982 through 1987; all amounts borrowed were to be repaid prior to the end of 1989. The only exercise of this authority occurred in 1982, when the OASI Trust Fund borrowed assets from the DI and HI Trust Funds. The final repayment of borrowed amounts occurred in 1986.

## Intermediate assumptions. See "Assumptions."

Legal emigration. Legal emigration for a given year consists of those legal permanent residents and native-born citizens who leave the Social Security area during the year.
Legal immigration. Consistent with the definition used by the Department of Homeland Security, legal immigration for a given year consists of foreignborn individuals who are granted legal permanent residence status during the year.
Life expectancy. Average remaining number of years expected prior to death. Period life expectancy is calculated for a given year using the actual or expected death rates at each age for that year. Cohort life expectancy, sometimes referred to as generational life expectancy, is calculated for individuals at a specific age in a given year using actual or expected death rates from the years in which the individuals would actually reach each succeeding age if he or she survives.
Long range. The next 75 years. Long-range actuarial estimates are made for this period because it is approximately the maximum remaining lifetime of current Social Security participants.
Low-cost assumptions. See "Assumptions."
Lump-sum death benefit. A lump sum, generally \$255, payable on the death of a fully or currently insured worker. The lump sum is payable to the surviving spouse of the worker, under most circumstances, or to the worker's children.
Maximum family benefit. The maximum monthly amount that can be paid on a worker's earnings record. Whenever the total of the individual monthly benefits payable to all the beneficiaries entitled on one earnings record exceeds the maximum, each dependent's or survivor's benefit is proportionately reduced to bring the total within the maximum. Benefits payable to divorced spouses or surviving divorced spouses are not reduced under the family maximum provision.

## Appendices

Medicare. A nationwide, Federally administered health insurance program authorized in 1965 to cover the cost of hospitalization, medical care, and some related services for most people age 65 and over. In 1972, coverage was extended to people receiving Social Security Disability Insurance payments for 2 years, and people with End-Stage Renal Disease. In 2006, prescription drug coverage was also added. Medicare consists of two separate but coordinated programs-Hospital Insurance (HI, Part A) and Supplementary Medical Insurance (SMI). The SMI program is composed of three separate accounts-the Part B Account, the Part D Account, and the Transitional Assistance Account. Almost all persons who are aged 65 and over or disabled and who are entitled to HI are eligible to enroll in Part B and Part D on a voluntary basis by paying monthly premiums. Health insurance protection is available to Medicare beneficiaries without regard to income.
Military service wage credits. Credits recognizing that military personnel receive wages in kind (such as food and shelter) in addition to their basic pay and other cash payments. Noncontributory wage credits of $\$ 160$ were provided for each month of active military service from September 16, 1940, through December 31, 1956. For years after 1956, the basic pay of military personnel is covered under the Social Security program on a contributory basis. In addition to the contributory credits for basic pay, noncontributory wage credits of $\$ 300$ were granted for each calendar quarter, from January 1957 through December 1977, in which a person received pay for military service. Noncontributory wage credits of $\$ 100$ were granted for each $\$ 300$ of military wages, up to a maximum credit of $\$ 1,200$ per calendar year, from January 1978 through December 2001.
National average wage index-AWI. See "Average wage index—AWI."
Normal retirement age. The age at which a person may first become entitled to retirement benefits without reduction based on age. For persons reaching age 62 before 2000, the normal retirement age is 65 . It will increase gradually to 67 for persons reaching that age in 2027 or later, beginning with an increase to 65 years and 2 months for persons reaching age 65 in 2003. See table V.C3.
Old-Age and Survivors Insurance (OASI) Trust Fund. See "Trust fund."
Old-law base. Amount the contribution and benefit base would have been if the discretionary increases in the base under the 1977 amendments had not been enacted. The Social Security Amendments of 1972 provided for automatic annual indexing of the contribution and benefit base. The Social Security Amendments of 1977 provided ad hoc increases to the bases for 1979-81, with subsequent bases updated in accordance with the normal indexing procedure. See table V.C2.
Open group unfunded obligation. This measure is computed as the excess of the present value of the projected cost of the program over a specified
time period (for example the next 75 years or the infinite future) over the sum of (1) the value of trust fund assets at the beginning of the period and (2) the present value of the projected tax income of the program, assuming scheduled tax rates and benefit levels.
Other emigration. Other emigration for a given year consists of individuals from the other-immigrant population who leave the Social Security area during the year or who adjust status to become legal permanent residents during the year.
Other immigration. Other immigration for a given year consists of individuals who enter the Social Security area and stay 6 months or more but without legal permanent residence status, such as undocumented immigrants and temporary workers and students.
Outgo. See "Disbursements."
Par value. The value printed on the face of a bond. For both public and special issues held by the trust funds, par value is also the redemption value at maturity.
Partial advance funding. A financing scheme where taxes are scheduled to provide a substantial accumulation of trust fund assets, thereby generating additional interest income to the trust funds and reducing the need for payroll tax increases in periods when costs are relatively high. (Higher general taxes or additional borrowing may be required, however, to support the payment of such interest.) While substantial, the trust fund buildup under partial advance funding is much smaller than it would be with full advance funding.
Pay-as-you-go financing. A financing scheme where taxes are scheduled to produce just as much income as required to pay current benefits, with trust fund assets built up only to the extent needed to prevent exhaustion of the fund by random economic fluctuations.
Payment cycling. Beneficiaries on the rolls before May 1, 1997, are paid on the third of the month. Persons applying for OASDI benefits after April 1997, however, generally are paid on the second, third, or fourth Wednesday of the month following the month for which payment is due. The particular Wednesday payment date is based on the earner's date of birth. For those born on the first through tenth, the benefit payment day is the second Wednesday of the month; for those born on the eleventh through the twentieth, the benefit payment day is the third Wednesday of the month; and for those born after the twentieth of the month, the payment day is the fourth Wednesday of the month.
Payroll taxes. A tax levied on the gross wages of workers. See tables VI.A1 and VI.F1.
Population in the Social Security area. See "Social Security area population."

## Appendices

Present value. The equivalent value, at the present time, of a future stream of payments (either income or cost). The present value of a future stream of payments may be thought of as the lump-sum amount that, if invested today, together with interest earnings would be just enough to meet each of the payments as they fell due. Present values are widely used in calculations involving financial transactions over long periods of time to account for the time value of money (interest). For the purpose of present-value calculations for this report, values are discounted by the effective yield on trust fund assets.
Primary insurance amount-PIA. The monthly amount payable to a retired worker who begins to receive benefits at normal retirement age or (generally) to a disabled worker. This amount, which is related to the worker's average monthly wage or average indexed monthly earnings, is also the amount used as a base for computing all types of benefits payable on the basis of one individual's earnings record.
Primary-insurance-amount formula. The mathematical formula relating the PIA to the AIME for workers who attain age 62, become disabled, or die after 1978. The PIA is equal to the sum of 90 percent of AIME up to the first bend point, plus 32 percent of AIME above the first bend point up to the second bend point, plus 15 percent of AIME in excess of the second bend point. Automatic benefit increases are applied beginning with the year of eligibility. See table V.C2 for historical and assumed future bend points and table V.C1 for historical and assumed future benefit increases.
Quarters of coverage. Basic unit of measurement for determining insured status. In 2009, a worker receives one quarter of coverage (up to a total of four) for each $\$ 1,090$ of annual covered earnings. The amount of earnings required for a quarter of coverage is subject to annual automatic increases in proportion to increases in average wages. For amounts applicable for years after 1978, see table V.C2.
Railroad retirement. A Federal insurance program, somewhat similar to Social Security, designed for workers in the railroad industry. The provisions of the Railroad Retirement Act provide for a system of coordination and financial interchange between the Railroad Retirement program and the Social Security program.
Reallocation of tax rates. An increase in the tax rate payable to either the OASI or DI Trust Fund, with a corresponding reduction in the rate for the other fund, so that the total OASDI tax rate is not changed.
Real-wage differential. The difference between the percentage increases in (1) the average annual wage in covered employment and (2) the average annual Consumer Price Index. See table V.B1.
Recession. A period of adverse economic conditions; in particular, two or more successive calendar quarters of negative growth in gross domestic product.

Retired-worker benefit. A monthly benefit payable to a fully insured retired worker aged 62 or older or to a person entitled under the transitionally insured status provision in the law.
Retirement earnings test. See "Earnings test."
Retirement eligibility age. The age (62) at which a fully insured individual first becomes eligible to receive retired-worker benefits.
Retirement test. See "Earnings test."
Self-employment. Operation of a trade or business by an individual or by a partnership in which an individual is a member.
Self-Employment Contributions Act-SECA. Provision authorizing Social Security taxes on the net earnings of most self-employed persons.
Short range. The next 10 years. Short-range actuarial estimates are prepared for this period because of the short-range test of financial adequacy. The Social Security Act requires estimates for 5 years; estimates are prepared for an additional 5 years to help clarify trends which are only starting to develop in the mandated first 5-year period.
Social Security Act. Provisions of the law governing most operations of the Social Security program. Original Social Security Act is Public Law 74-271, enacted August 14, 1935. With subsequent amendments, the Social Security Act consists of 20 titles, of which four have been repealed. The Old-Age, Survivors, and Disability Insurance program is authorized by title II of the Social Security Act.
Social Security area population. The population comprised of (i) residents of the 50 States and the District of Columbia (adjusted for net census undercount); (ii) civilian residents of Puerto Rico, the Virgin Islands, Guam, American Samoa and the Northern Mariana Islands; (iii) Federal civilian employees and persons in the U.S. Armed Forces abroad and their dependents; (iv) crew members of merchant vessels; and (v) all other U.S. citizens abroad.
Solvency. A program is solvent at a point in time if it is able to pay scheduled benefits when due with scheduled financing. For example, the OASDI program is considered solvent over any period for which the trust funds maintain a positive balance throughout the period.
Special public-debt obligation. Securities of the United States Government issued exclusively to the OASI, DI, HI, and SMI Trust Funds and other Federal trust funds. Section 201(d) of the Social Security Act provides that the public-debt obligations issued for purchase by the OASI and DI Trust Funds shall have maturities fixed with due regard for the needs of the funds. The usual practice has been to spread the holdings of special issues, as of each June 30, so that the amounts maturing in each of the next 15 years are approximately equal. Special public-debt obligations are redeemable at par

## Appendices

value at any time and carry interest rates determined by law (see "Interest rate"). See tables VI.A5 and VI.A6 for a listing of the obligations held by the OASI and DI Trust Funds, respectively.
Statutory blindness. Central visual acuity of 20/200 or less in the better eye with the use of a correcting lens or tunnel vision of $20^{\circ}$ or less.
Stochastic model. A model used for projecting a probability distribution of potential outcomes. Such models allow for random variation in one or more variables through time. The random variation is generally based on fluctuations observed in historical data for a selected period. Distributions of potential outcomes are derived from a large number of simulations, each of which reflects random variation in the variable(s).
Substantial gainful activity-SGA. The level of work activity used to establish disability. A finding of disability requires that a person be unable to engage in substantial gainful activity. A person who is earning more than a certain monthly amount (net of impairment-related work expenses) is ordinarily considered to be engaging in SGA. The amount of monthly earnings considered as SGA depends on the nature of a person's disability. The Social Security Act specifies a higher SGA amount for statutorily blind individuals; Federal regulations specify a lower SGA amount for non-blind individuals. Both SGA amounts increase with increases in the national average wage index.

Summarized balance. The difference between the summarized cost rate and the summarized income rate, expressed as a percentage of taxable payroll.
Summarized cost rate. The ratio of the present value of cost to the present value of the taxable payroll for the years in a given period, expressed as a percentage. This percentage can be used as a measure of the relative level of cost during the period in question. For purposes of evaluating the financial adequacy of the program, the summarized cost rate is adjusted to include the cost of reaching and maintaining a target trust fund level. Because a trust fund level of about 1 year's cost is considered to be an adequate reserve for unforeseen contingencies, the targeted trust fund ratio used in determining summarized cost rates is 100 percent of annual cost. Accordingly, the adjusted summarized cost rate is equal to the ratio of (a) the sum of the present value of the cost during the period plus the present value of the targeted ending trust fund level, to (b) the present value of the taxable payroll during the projection period.
Summarized income rate. The ratio of the present value of scheduled tax income to the present value of taxable payroll for the years in a given period, expressed as a percentage. This percentage can be used as a measure of the relative level of income during the period in question. For purposes of evaluating the financial adequacy of the program, the summarized income rate is adjusted to include assets on hand at the beginning of the period. Accord-
ingly, the adjusted summarized income rate equals the ratio of (a) the sum of the trust fund balance at the beginning of the period plus the present value of the total income from taxes during the period, to (b) the present value of the taxable payroll for the years in the period.
Supplemental Security Income-SSI. A Federally administered program (often with State supplementation) of cash assistance for needy aged, blind, or disabled persons. SSI is funded through the General Fund of the Treasury and administered by the Social Security Administration.
Supplementary Medical Insurance (SMI) Trust Fund. See "Trust fund."
Survivor benefit. Benefit payable to a survivor of a deceased worker.
Sustainable solvency. Sustainable solvency for the financing of the program is achieved when the program has positive trust fund ratios throughout the 75 -year projection period and these ratios are stable or rising at the end of the period.
Taxable earnings. Wages and/or self-employment income, in employment covered by the OASDI and/or HI programs, that is under the applicable annual maximum taxable limit. For 1994 and later, no maximum taxable limit applies to the HI program.
Taxable payroll. A weighted average of taxable wages and taxable selfemployment income. When multiplied by the combined employee-employer tax rate, it yields the total amount of taxes incurred by employees, employers, and the self-employed for work during the period.
Taxable self-employment income. The maximum amount of net earnings from self-employment by an earner which, when added to any taxable wages, does not exceed the contribution and benefit base. For HI beginning in 1994, all of net earnings from self-employment.
Taxable wages. See "Taxable earnings."
Taxation of benefits. During 1984-93, up to one-half of an individual's or a couple's OASDI benefits was potentially subject to Federal income taxation under certain circumstances. The revenue derived from this provision was allocated to the OASI and DI Trust Funds on the basis of the income taxes paid on the benefits from each fund. Beginning in 1994, the maximum portion of OASDI benefits potentially subject to taxation was increased to 85 percent. The additional revenue derived from taxation of benefits in excess of one-half, up to 85 percent, is allocated to the HI Trust Fund.
Taxes. See "Contributions."
Termination. Cessation of payment of a specific type of benefit because the beneficiary is no longer entitled to receive it. For example, benefits might terminate as a result of the death of the beneficiary, the recovery of a disabled beneficiary, or the attainment of age 18 by a child beneficiary. In some cases, the individual may become immediately entitled to another type of

## Appendices

benefit (such as the conversion of a disabled-worker beneficiary at normal retirement age to a retired-worker beneficiary).
Test of long-range close actuarial balance. Summarized income rates and cost rates are calculated for each of 66 valuation periods within the full 75year long-range projection period. The first of these periods consists of the next 10 years. Each succeeding period becomes longer by 1 year, culminating with the period consisting of the next 75 years. The long-range test is met if, for each of the 66 valuation periods, the actuarial balance is not less than zero or is negative by, at most, a specified percentage of the summarized cost rate for the same time period. The percentage allowed for a negative actuarial balance is 0 percent for the 10 -year period, grading uniformly to 5 percent for the full 75 -year period. The criterion for meeting the test is less stringent for the longer periods in recognition of the greater uncertainty associated with estimates for more distant years. The test is applied to OASI and DI separately, as well as combined, based on the intermediate set of assumptions.
Test of short-range financial adequacy. The conditions required to meet this test are as follows:

- If the trust fund ratio for a fund exceeds 100 percent at the beginning of the projection period, then it must be projected to remain at or above 100 percent throughout the 10 -year projection period;
- Alternatively, if the fund ratio is initially less than 100 percent, it must be projected to reach a level of at least 100 percent within 5 years (and not be depleted at any time during this period) and then remain at or above 100 percent throughout the remainder of the 10 -year period. In addition, the fund's estimated assets at the beginning of each month of the 10 -year period must be sufficient to cover that month's disbursements.

These conditions apply to each trust fund separately, as well as to the combined funds, and are evaluated based on the intermediate set of assumptions.
Total fertility rate. The average number of children that would be born to a woman in her lifetime if she were to experience the birth rates by age observed in, or assumed for, a specified year, and if she were to survive the entire childbearing period.
Trust fund. Separate accounts in the United States Treasury in which are deposited the taxes received under the Federal Insurance Contributions Act and the Self-Employment Contributions Act, as well as taxes resulting from coverage of State and local government employees; any sums received under the financial interchange with the railroad retirement account; voluntary hospital and medical insurance premiums; and transfers of Federal general revenues. Funds not withdrawn for current monthly or service benefits, the
financial interchange, and administrative expenses are invested in interestbearing Federal securities, as required by law; the interest earned is also deposited in the trust funds.

- Old-Age and Survivors Insurance (OASI). The trust fund used for paying monthly benefits to retired-worker (old-age) beneficiaries and their spouses and children and to survivors of deceased insured workers.
- Disability Insurance (DI). The trust fund used for paying monthly benefits to disabled-worker beneficiaries and their spouses and children and for providing rehabilitation services to the disabled.
- Hospital Insurance (HI). The trust fund used for paying part of the costs of inpatient hospital services and related care for aged and disabled individuals who meet the eligibility requirements. Also known as Medicare Part A.
- Supplementary Medical Insurance (SMI). The Medicare trust fund composed of the Part B Account, the Part D Account, and the Transitional Assistance Account. The Part B Account pays for a portion of the costs of physicians' services, outpatient hospital services, and other related medical and health services for voluntarily enrolled aged and disabled individuals. The Part D Account pays private plans to provide prescription drug coverage, beginning in 2006. The Transitional Assistance Account paid for transitional assistance under the prescription drug card program in 2004 and 2005.
Trust fund ratio. A measure of the adequacy of the trust fund level. Defined as the assets at the beginning of a year, including advance tax transfers (if any), expressed as a percentage of the cost during the year. The trust fund ratio represents the proportion of a year's cost which could be paid with the funds available at the beginning of a year.
Unfunded obligation. See "Open group unfunded obligation" and "Closed group unfunded obligation".
Unnegotiated check. A check which has not been cashed 6 months after the end of the month in which the check was issued. When a check has been outstanding for a year (i) the check is administratively cancelled by the Department of the Treasury and (ii) the issuing trust fund is reimbursed separately for the amount of the check and interest for the period the check was outstanding. The appropriate trust fund also receives an interest adjustment for the time the check was outstanding if it is cashed 6-12 months after the month of issue. If a check is presented for payment after it is administratively cancelled, a replacement check is issued.
Valuation period. A period of years which is considered as a unit for purposes of calculating the financial status of a trust fund.

## Appendices

Vocational rehabilitation. Services provided to disabled persons to help enable them to return to gainful employment. Reimbursement from the trust funds for the costs of such services is made only in those cases where the services contributed to the successful rehabilitation of the beneficiaries.
Year of exhaustion. The year in which a trust fund would become unable to pay benefits when due because the assets of the fund were exhausted.

## II. OVERVIEW

## II.B1 Summary of 2008 Trust Fund Financial Operations <br> 5

II.B2 Tax Rates for 2008 and Later ..... 5

## STATEMENT OF ACTUARIAL OPINION

It is my opinion that (1) the techniques and methodology used herein to evalmate the financial and actuarial status of the Federal Old-Age and Survivors Insurance and Disability Insurance Trust Funds are based upon sound principles of actuarial practice and are generally accepted within the actuarial profession; and (2) the assumptions used and the resulting actuarial estimates are, individually and in the aggregate, reasonable for the purpose of evaluating the financial and actuarial status of the trust funds, taking into consideration the past experience and future expectations for the population, the economy, and the program.

Stephen C. Goss,
Associate of the Society of Actuaries, Member of the American Academy of Actuaries, Chief Actuary, Social Security Administration

[^0]:    ${ }^{1}$ Data on trust fund operations are available on the Social Security website at www.socialsecurity.gov/OACT/ProgData/fundsQuery.html.

[^1]:    ${ }^{1}$ Vocational rehabilitation services are furnished to disabled widow(er) beneficiaries and to those children of retired or deceased workers who were receiving benefits on the basis of disabilities that began before age 22. Reimbursement from the trust funds for the costs of vocational rehabilitation services is made only in those cases where the services contributed to the successful rehabilitation of the beneficiary.

[^2]:    ${ }^{1}$ Estimated amounts used to calculate percentage differences are before rounding to amounts shown in the annual reports.

[^3]:    ${ }^{1}$ The estimates shown in this subsection reflect 12 months of benefit payments in each year of the shortrange projection period. In practice, the actual payment dates have at times been shifted over calendar year boundaries as a result of the statutory requirement that benefit checks be delivered early when the normal check delivery date is a Saturday, Sunday, or legal public holiday. The annual benefit figures are shown as if those benefit checks were delivered on the usual date.

[^4]:    ${ }^{1}$ Note that the pattern, by alternative, of these nominal amounts of total taxable earnings is not what might be expected, but the reverse, because of the varying inflation assumptions embedded in the respective estimates.

[^5]:    ${ }^{1}$ Historical and projected patterns of disability incidence rates are described in greater detail in section V.C.6.

[^6]:    ${ }^{1}$ Adjustments are made to include deemed wage credits based on military service for 1983-2001, and to reflect the lower effective tax rates (as compared to the combined employee-employer rate) that apply to multiple-employer "excess wages," and that did apply, before 1984, to net earnings from self-employment and, before 1988, to income from tips.
    ${ }^{2}$ In this context, the term balance does not represent the assets of the trust funds, which are sometimes referred to as the balance in the trust funds.

[^7]:    ${ }^{1}$ Further details about the assumptions, methods, and actuarial estimates are contained in Actuarial Studies published by the Office of the Chief Actuary, Social Security Administration. A complete list of available studies may be found on the Social Security website at:
    www.socialsecurity.gov/OACT/NOTES/actstud.html. To obtain copies of such studies, or of this report, submit a request via our Internet request form at www.socialsecurity.gov/OACT/request.html; or write to: Office of the Chief Actuary, 700 Altmeyer Building, 6401 Security Boulevard, Baltimore, MD 21235; or call 410-965-3000. This entire report, along with supplemental year-by-year tables, may also be found at www.socialsecurity.gov/OACT/TR/TR09/index.html.

[^8]:    ${ }^{1}$ Defined to be the average number of children that would be born to a woman in her lifetime if she were to experience the birth rates by age observed in, or assumed for, the selected year, and if she were to survive the entire childbearing period. A rate of 2.1 would ultimately result in a nearly constant population if net immigration were zero and if death rates were constant.

[^9]:    ${ }^{1}$ These rates reflect NCHS data on deaths and Census estimates of population.
    ${ }^{2}$ Calculated here as the crude rate that would occur in the enumerated total population, as of April 1, 2000, if that population were to experience the death rates by age and sex for the selected year.
    ${ }^{3}$ Average rate of decline is calculated as the annual geometric rate of reduction between the first and last years of the period.

[^10]:    ${ }^{1}$ Excludes those persons who attained legal permanent resident status under the special, one-time provisions of the Immigration Reform and Control Act of 1986.

[^11]:    ${ }^{1}$ Determination of the December 2007 Peak in Economic Activity, Business Cycle Dating Committee, National Bureau of Economic Research (NBER). Access date March 3, 2009.
    http://www.nber.org/cycles/dec2008.html

[^12]:    ${ }^{1}$ Historical levels of real GDP are from the Bureau of Economic Analysis' (BEA) National Income and Product Accounts (NIPA). Historical total hours worked is an unpublished series provided by the Bureau of Labor Statistics (BLS), and is for all U.S. Armed Forces and civilian employment.

[^13]:    ${ }^{1}$ Details of these indexation procedures are published annually in the Federal Register, and are also available on the Social Security website at www.socialsecurity.gov/OACT/COLA/index.html.

[^14]:    ${ }^{1}$ Incidence rates are adjusted upward to account for additional workers who are expected to file for disability benefits (rather than retirement benefits) in response to greater reductions in retirement benefits as the NRA rises.
    ${ }^{2}$ A more detailed discussion of the recent history of the DI program is presented in Actuarial Study 118, "Social Security Disability Insurance Program Worker Experience," June 2005. This study can be found at www.socialsecurity.gov/OACT/NOTES/s2000s.html.

[^15]:    ${ }^{1}$ Projections are developed separately for the short range (through 2018) and for the long range (after 2018). While short-range assumptions vary within the 10 -year short-range period, the full phase in to the ultimate assumptions is not achieved until 2028. Death rates differ in this regard as explained in the text.
    2 The termination rate analysis was based on work presented in Actuarial Study 118, "Social Security Disability Insurance Program Worker Experience," June 2005. This study can be found on the Social Security website at www.socialsecurity.gov/OACT/NOTES/s2000s.html.

[^16]:    ${ }^{1}$ The contribution rates for the Hospital Insurance (HI) program, and for the OASDI and HI programs combined, are shown in table VI.F1.

[^17]:    ${ }^{1}$ The additional tax revenues resulting from the increase to 85 percent are transferred to the HI Trust Fund. ${ }^{2}$ A special provision applies to benefits paid to nonresident aliens. Under Public Law 103-465, effective for taxable years beginning after 1994, a flat-rate tax, usually 25.5 percent, is withheld from the benefits before they are paid and, therefore, remains in the trust funds. From 1984 to 1994 the flat-rate tax that was withheld was usually 15 percent.

[^18]:    ${ }^{1}$ Age adjusted to the total disabled workers in current-payment status as of the year 2000.

[^19]:    ${ }^{1}$ www.socialsecurity.gov/OACT/stochastic/index.html

[^20]:    ${ }^{1}$ More details are provided on scaled-earnings patterns in the Social Security Administration Actuarial Note Number 2008.3, located at the following internet address:
    www.socialsecurity.gov/OACT/NOTES/ran3/an2008-3.html.
